## What is Hyper Computing Cluster?

Hyper Computing Cluster uses high-performance CVM instances as nodes, and instances are interconnected via Remote Direct Memory Access (RDMA). It offers high bandwidth and ultra-low latency network services, significantly improving network performance. It can meet the parallel computing needs of large-scale high-performance computing, AI, big data recommendations, and other applications.

## What operating systems does Hyper Computing Cluster support?

Hyper Computing Cluster instances use the same image system as CVM instances. Operating systems like CentOS, Ubuntu, and Windows are supported. Tencent Cloud is continuously working to support more operating systems. Please stay tuned.

## What purchasing channels are provided for Hyper Computing Cluster?

You can purchase Hyper Computing Cluster on the official website or through APIs or SDKs.
