Getting Started

Website Business Connection

Last updated : 2020-07-30 12:09:38

This document describes how to connect a website business to an Anti-DDoS Advanced instance and verify the forwarding configuration.

Currently, only website businesses in Beijing, Shanghai, and Guangzhou regions can be connected. Businesses outside Mainland China are not supported.

Prerequisites

- To add a forwarding rule, you need to [purchase an Anti-DDoS Advanced instance in Mainland China](#) or [outside Mainland China](#).
- To modify the DNS information of your business domain name, you need to purchase the domain name resolution product.

Process

Directions

Configuring forwarding rule

1. Log in to the [new Anti-DDoS Advanced Console](#) and click **Business Connection** on the left sidebar.

2. On the "Business Connection" page, select the **Domain Name Connection** tab and click **Add Domain Name**.

Application Accessing Purchase

Access via ports Access via domain names

Add Domain Name

Application domain ...	Forwarding Protocol	Forwarding Port	Origin server IP/site	Associated Protecti...	Health check	Status	Modification Time	Operation
No data yet								

Total items: 0 10 / page 1 / 1 page

3. On the forwarding rule adding page, configure the following parameters as needed:

Create Layer-7 Forwarding Rule ✕

Associated Protecting IP

Domain name
Please enter the domain name. The length does not exceed 80

Protocol http https

Forwarding method Forwarding via IP Forwarding via domain name

Origin IP
Please enter the origin IP or origin IP + port, separated by ":", for example 1.1.1.1 or 1.1.1.1:50. Separate multiple origin IPs or origin IP+ ports with carriage returns. Up to 16 items are allowed

Parameter description:

- Domain Name: enter the website domain name to be protected.
- Protocol: HTTP and HTTPS are supported. Please select an option as needed:

Business Scenario	Relevant Operation
Websites supporting only HTTP	Select **HTTP** .
Websites supporting only HTTPS	<ul style="list-style-type: none"> Select **HTTPS**. Certificate source: Tencent Cloud-hosted certificate is selected by default. Certificate: select the name of the corresponding SSL certificate.

- Forwarding Method: **forwarding via IP** and **forwarding via domain name** are supported.
 - If you select **Forwarding via IP**, enter the IP (or IP + port) of the real server. If one website domain name corresponds to multiple real server IPs (or IP + port pairs), you can enter all of them and separate them with carriage return. Up to 16 IPs (or IP + port pairs) are supported.
 - If you select **Forwarding via domain name**, enter the real server domain name (CNAME) or domain name (CNAME) + port. If one website domain name corresponds to multiple real server domain names (CNAMEs) or pairs of domain name (CNAME) + port, you can enter all of them and separate them with carriage returns. Up to 16 entries are supported.

Opening forwarding IP range

To prevent business interruption that occurs if the real server blocks the Anti-DDoS Advanced forwarding IP, you are recommended to configure allowlist policies for the real server infrastructure (such as firewall, web application firewall, intrusion protection system (IPS), and traffic management system) and disable the protection features of the server firewall and other security software tools (such as Safedog) or set allowlist policies for them, so that the forwarding IP will not be affected by the security policies of the real server.

You can log in to the [new Anti-DDoS Advanced Console](#) and click **Instance List** on the left sidebar to find the target instance ID.

Service Packages								Purchase

Basic Information

Anti-DDoS Advanced Name	Unnamed ✎	Current Status	Running
Location	Shanghai	Expiry Time	2020-08-06
IP	117.184.254.232	Forwarding IP Range	212.64.62.0/24 180.97.124.0/24 153.3.137.0/24 212.129.225.0/24 117.184.254.0/24
Base Protection Bandwidth	50Gbps		
CC Protection Peak	150000QPS		
Line	CMCC		
Max forwarding rules	60		

Verifying configuration locally

After the forwarding configuration is completed, the Anti-DDoS Advanced IP will forward the packets from the relevant port to the corresponding real server port according to the forwarding rule. To ensure the stability of your business, a local test is recommended. The verification method is as follows:

1. Modify the local `hosts` file to direct local requests to the protected site to your Anti-DDoS Advanced instance. The following uses Windows as an example to describe how to configure the local `hosts` file:

Open the `hosts` file in `C:\Windows\System32\drivers\etc` and add the following content at the end of the file:

```
<Anti-DDoS Advanced IP address> <Domain name of the protected website>
```

For example, if the Anti-DDoS Advanced IP is `10.1.1.1` and the domain name is `www.qq.com`, then add:

```
10.1.1.1 www.qq.com
```

Save the `hosts` file and run the `ping` command on the local computer to ping the protected domain name. If the resolved IP address is the Anti-DDoS Advanced IP address bound in the `hosts` file, the local `hosts` configuration has taken effect.

If the resolved IP address is still the real server IP address, try running the `ipconfig /flushdns` command in Windows Command Prompt to clear the local DNS cache.

2. After successfully configuring the `hosts` , check whether the domain name can be accessed. If it can be accessed properly, the configuration has taken effect.

If the verification still fails with the correct method, please log in to the Anti-DDoS Advanced Console and check whether the configuration is correct. If the problem persists after you fix any incorrect configuration items, please [submit a ticket](#) for assistance.

Non-website Business Connection

Last updated : 2020-07-30 12:10:24

This document describes how to connect a non-website business to an Anti-DDoS Advanced instance and verify the forwarding configuration.

Prerequisites

- To add a forwarding rule, you need to [purchase an Anti-DDoS Advanced instance in Mainland China](#) or [outside Mainland China](#).
- To modify the DNS information of your business domain name, you need to purchase the domain name resolution product.

Process

Directions

Configuring forwarding rule

1. Log in to the [new Anti-DDoS Advanced Console](#) and click **Business Connection** on the left sidebar.

2. On the "Business Connection" page, select the **Port Connection** tab and click **Add Rule**.

The screenshot shows the 'Application Accessing' interface. At the top right is a 'Purchase' button. Below it are two tabs: 'Access via ports' (selected) and 'Access via domain names'. A blue 'Add rule' button is on the left, followed by a search input field labeled 'Enter IP'. Below this is a table with the following columns: 'Forwa...', 'Forwa...', 'Origin Server P...', 'Origin', 'Associated Protectin...', 'Load Balancing Mode', 'Health check', 'Session Persistence', 'Modification Time', and 'Operation'. The table body is empty, displaying 'No data yet'. At the bottom left, it says 'Total items: 0'. At the bottom right, there is a pagination control showing '10 / page' and '1 / 1 page'.

3. On the forwarding rule adding page, configure the following parameters as needed:

Create Layer-4 Forwarding Rule [Close]

Associated Protecting IP:

Forwarding Protocol:

Forwarding Port:

Origin Server Port:

Forwarding method: Forwarding via IP Forwarding via domain name

Load Balancing Mode: Weighted polling

Origin IP + Weight:

Please enter the combination of origin domain name and weight in the format of "qcloud.com 50". Separate multiple entries with carriage returns. It supports up to 20 entries.

Parameter description:

- Associated Anti-DDoS Advanced IP: select the target IP.
- Forwarding Protocol: TCP and UDP are supported.
- Forwarding Port: it is the Anti-DDoS Advanced IP port to be accessed. You are recommended to select the same port as that of the real server. Port 843 cannot be used as the forwarding port of an Anti-DDoS Advanced IP in all regions except Beijing and Guangzhou.
- Real Server Port: it is the real port of your business website.
- Forwarding Method: forwarding via IP and forwarding via domain name are supported.
- Load Balancing Method: only weighted round-robin is supported currently.
- Real Server IP + Weight or Real Server Domain Name: enter the real server IP + weight or real server domain name based on the **forwarding method**. Up to 20 pairs of IP + weight or domain names are supported.
 - If you select **Forwarding via IP**, enter the real server IP address + weight such as `1.1.1.1 50` . If a domain name corresponds to multiple pairs of real server IP + weight, you can enter all of them and separate them with carriage returns. Up to 20 entries are supported.
 - If you select **Forwarding via domain name**, enter the real server domain name. If one domain name corresponds to multiple real server domain names, you can enter all of them and separate them with carriage returns. Up to 20 entries are supported.

Opening forwarding IP range

To prevent business interruption that occurs if the real server blocks the Anti-DDoS Advanced forwarding IP, you are recommended to configure allowlist policies for the real server infrastructure (such as firewall, web application firewall, intrusion protection system (IPS), and traffic management system) and disable the protection features of the server firewall and other security software tools (such as Safedog) or set allowlist policies for them, so that the forwarding IP will not be affected by the security policies of the real server.

You can log in to the [new Anti-DDoS Advanced Console](#) and click **Instance List** on the left sidebar to find the target instance ID.

Basic Information

Anti-DDoS Advanced Name	Unnamed ✎	Current Status	Running
Location	Hong Kong, China	Expiry Time	2020-08-02
IP	119.28.217.239	Forwarding IP Range	119.28.191.0/24 119.28.44.0/24 119.28.85.0/24 119.28.3.0/24 119.28.187.0/24 119.28.186.0/24 119.28.193.0/24 119.28.217.0/24
Base Protection Bandwidth	20Gbps		
CC Protection Peak	40000QPS		
Line	BGP		
Max forwarding rules	60		

Verifying configuration locally

After the forwarding configuration is completed, the Anti-DDoS Advanced IP will forward the packets from the relevant port to the corresponding real server port according to the forwarding rule.

To ensure the stability of your business, a local test is recommended. The verification method is as follows:

- **For businesses accessed through IPs**

For businesses accessed through IPs (such as games), run `telnet` to check whether the Anti-DDoS Advanced port is accessible. You can also enter the Anti-DDoS Advanced IP as the server IP in your local client (if available) to check whether the local client can connect to it.

For example, if your Anti-DDoS Advanced IP is `10.1.1.1` with forwarding port `1234`, and your real server IP is `10.2.2.2` with port `1234`, when you run `telnet` locally to access `10.1.1.1:1234`, if the address can be accessed, the forwarding is successful.

- **For businesses accessed through domain names**

For businesses accessed through domain names, you can modify the local `hosts` file to verify whether the configuration has taken effect.

a. Modify the local `hosts` file to direct local requests to the protected site to your Anti-DDoS Advanced instance. The following uses Windows as an example to describe how to configure the local `hosts` file:

Open the `hosts` file in `C:\Windows\System32\drivers\etc` and add the following content at the end of the file:

```
<Anti-DDoS Advanced IP address> <Domain name of the protected website>
```

For example, if the Anti-DDoS Advanced IP is `10.1.1.1` and the domain name is `www.qq.com`, then add:

```
10.1.1.1 www.qq.com
```

Save the `hosts` file and run the `ping` command on the local computer to ping the protected domain name. If the resolved IP address is the Anti-DDoS Advanced IP address bound in the `hosts` file, the local `hosts` configuration has taken effect.

If the resolved IP address is still the real server IP address, try running the `ipconfig /flushdns` command in Windows Command Prompt to clear the local DNS cache.

b. After successfully configuring the `hosts`, check whether the domain name can be accessed. If it can be accessed properly, the configuration has taken effect.

If the verification still fails with the correct method, please log in to the Anti-DDoS Advanced Console and check whether the configuration is correct. If the problem persists after you fix any incorrect configuration items, please contact [Tencent Cloud technical support](#).
