SDK 3.0 is a companion tool for the TencentCloud API 3.0 platform. You can use all SMS APIs through the SDK. The new SDK version is unified and features the same SDK usage, API call methods, error codes, and returned packet formats for different programming languages.
Relevant documentation and SDK source code can be obtained as follows:

Platform	SDK Documentation	GitHub Address
Java	SDK for Java documentation	SDK for Java
PHP	SDK for PHP documentation	SDK for PHP
Python	SDK for Python documentation	SDK for Python
JavaScript	SDK for Node.js documentation	SDK for Node.js
C#	SDK for C# documentation	SDK for C#
Go	SDK for Go documentation	SDK for Go
C++	SDK for C++ documentation	C++ SDK

Note:
All the SMS SDKs in this document are on the latest 3.0 version, and new SMS features will be updated here. You are strongly recommended to use SDK 3.0 and the supportive API 3.0.
Existing APIs and SDKs on version 2.0 are still available but may be disused in the future.

SDK for Java

Last updated：2024-06-27 15:48:00

SDK 3.0 is a companion tool for the TencentCloud API 3.0 platform. You can use all SMS APIs through the SDK. The new SDK version is unified and features the same SDK usage, API call methods, error codes, and returned packet formats for different programming languages.

Note:

API version required for connecting to Tencent Cloud International:

SMS API v2021-01-11 is required. For details, see the sample code.

SMS sending APIs:

One message can be sent to up to 200 numbers at a time.

Signature and body template APIs:

Individual users have no permission to use signature and body template APIs and can manage SMS signatures and SMS body templates only in the SMS console. To use the APIs, change "Individual Identity" to "Organizational Identity".

Prerequisites

You have learned about the concept of region and selected a region as needed.

You have activated SMS. For detailed directions, please see Getting Started.

You have obtained the `SecretID` and `SecretKey` on the API Key Management page in the CAM console.

`SecretID` is used to identify the API caller.

`SecretKey` is used to encrypt the string to sign that can be verified on the server. **You should keep it private and avoid disclosure.**

The endpoint of the SMS service is `sms.tencentcloudapi.com`.

Relevant Documents

For more information on the APIs and their parameters, please see API Documentation.

You can download the SDK source code from Github Repository.

Installing SDK

Installing via Maven (recommended)

See Github Repository: Installing via Maven (recommended)

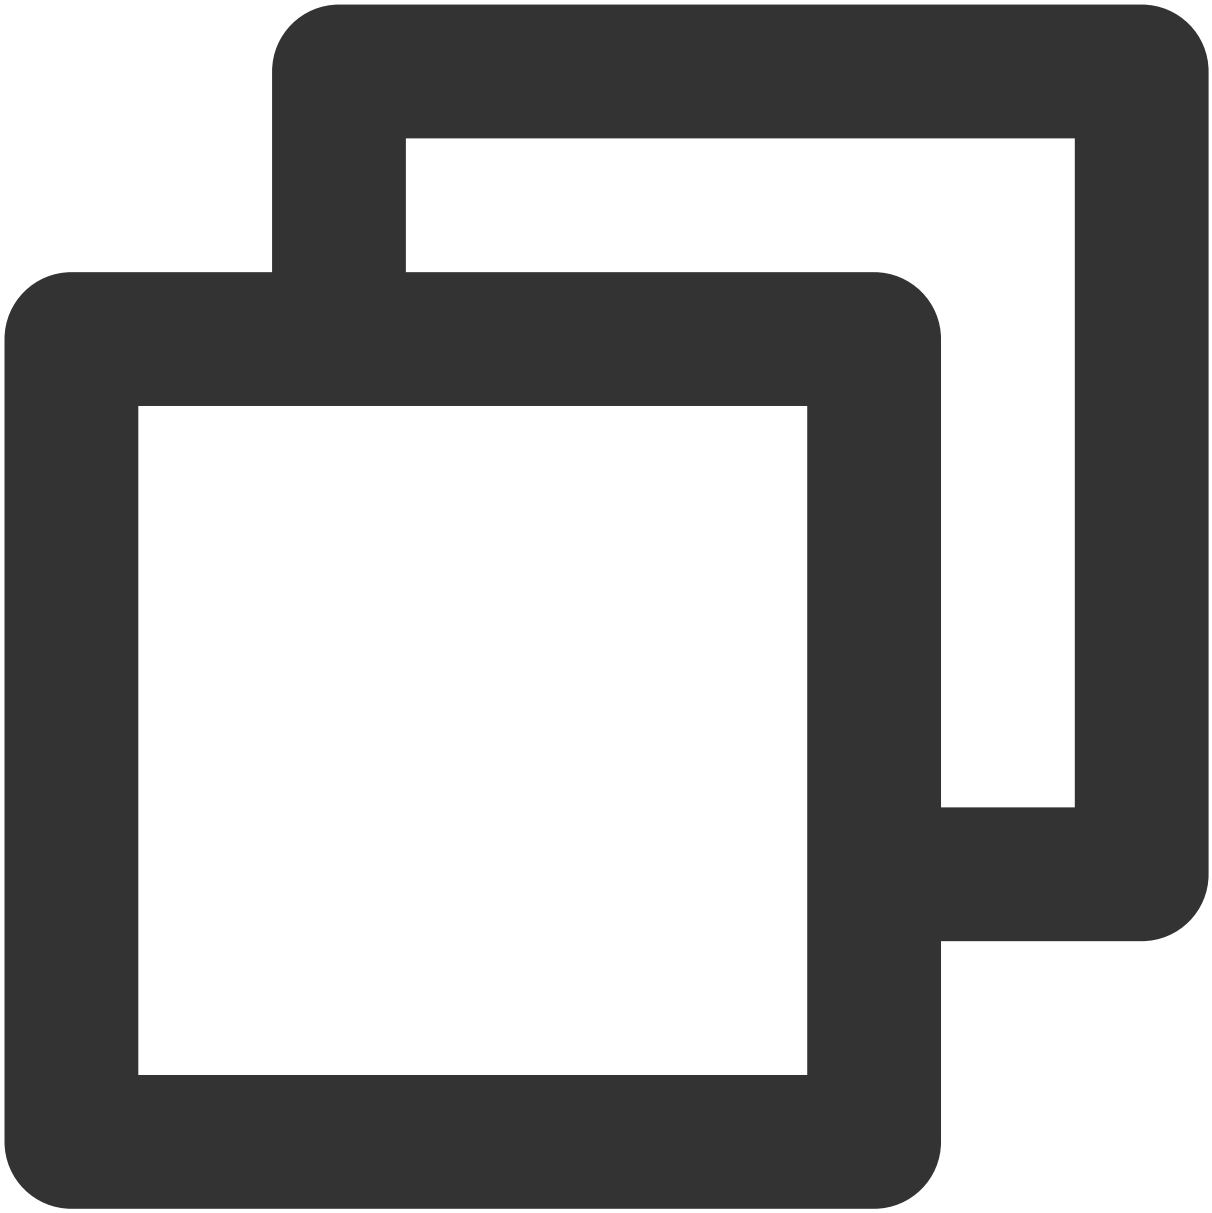
Installing via source package

See Github repository: Installing via source package

Sample Code

Note:
All samples are for reference only and cannot be directly compiled and executed. You need to modify them based on your actual needs. You can also use API 3.0 Explorer to automatically generate the demo code as needed.
Each API has a corresponding request structure and a response structure. This document only lists the sample code of several common features as shown below:

Sending SMS message



```
import com.tencentcloudapi.common.Credential;
import com.tencentcloudapi.common.exception.TencentCloudSDKException;

// Import the optional configuration classes
import com.tencentcloudapi.common.profile.ClientProfile;
import com.tencentcloudapi.common.profile.HttpProfile;

// Import the client of the corresponding SMS module
import com.tencentcloudapi.sms.v20210111.SmsClient;

// Import the request response class corresponding to the request API
```

```
import com.tencentcloudapi.sms.v20210111.models.SendSmsRequest;
import com.tencentcloudapi.sms.v20210111.models.SendSmsResponse;

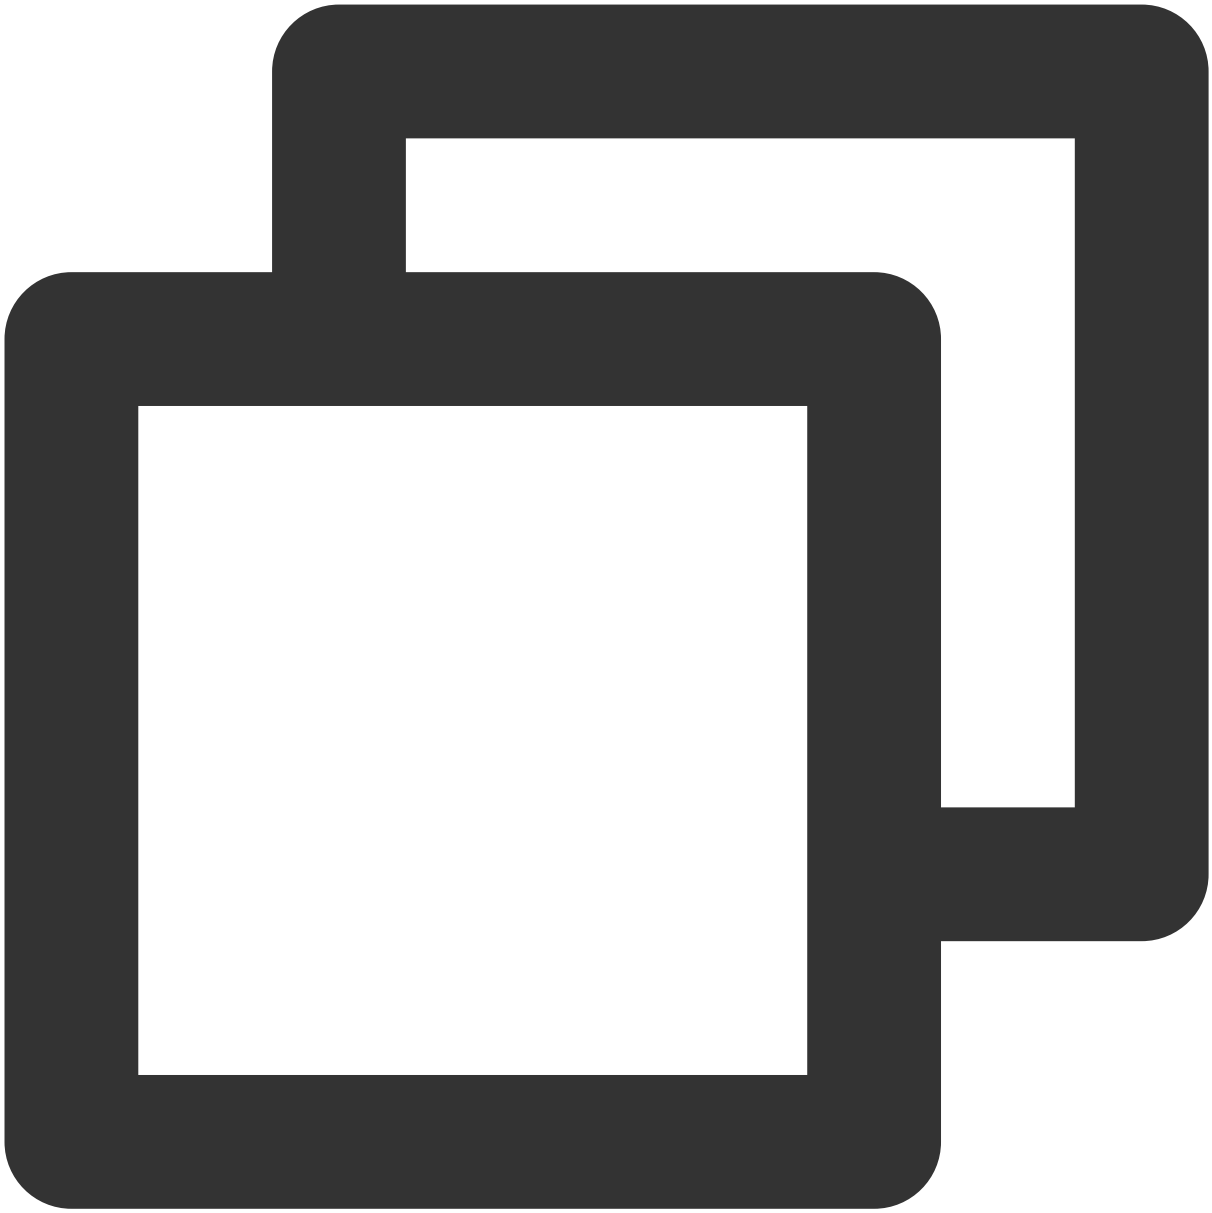
FAQs

java.lang.NoSuchMethodError: xxx.setSkipSign issue

During the usage, some users may encounter the error: `java.lang.NoSuchMethodError: xxx.setSkipSign`. This is due to a version mismatch between the `tencentcloud-sdk-java-common` package and the `tencentcloud-sdk-java-sms` package.

The issue could be caused by specifying an incorrect version of the `common` package in the pom, or by indirectly referencing an incompatible `common` version due to the reference to other third-party SDKs.

The solution is to explicitly specify the same version of the `common` package in pom.xml. For example, if the version of `tencentcloud-sdk-java-sms` is `3.1.1000`, you can specify the `common` package version like this:



```
<dependency>
    <groupId>com.tencentcloudapi</groupId>
    <artifactId>tencentcloud-sdk-java-common</artifactId>
    <version>3.1.1000</version>
</dependency>
```

Kotlin Issue

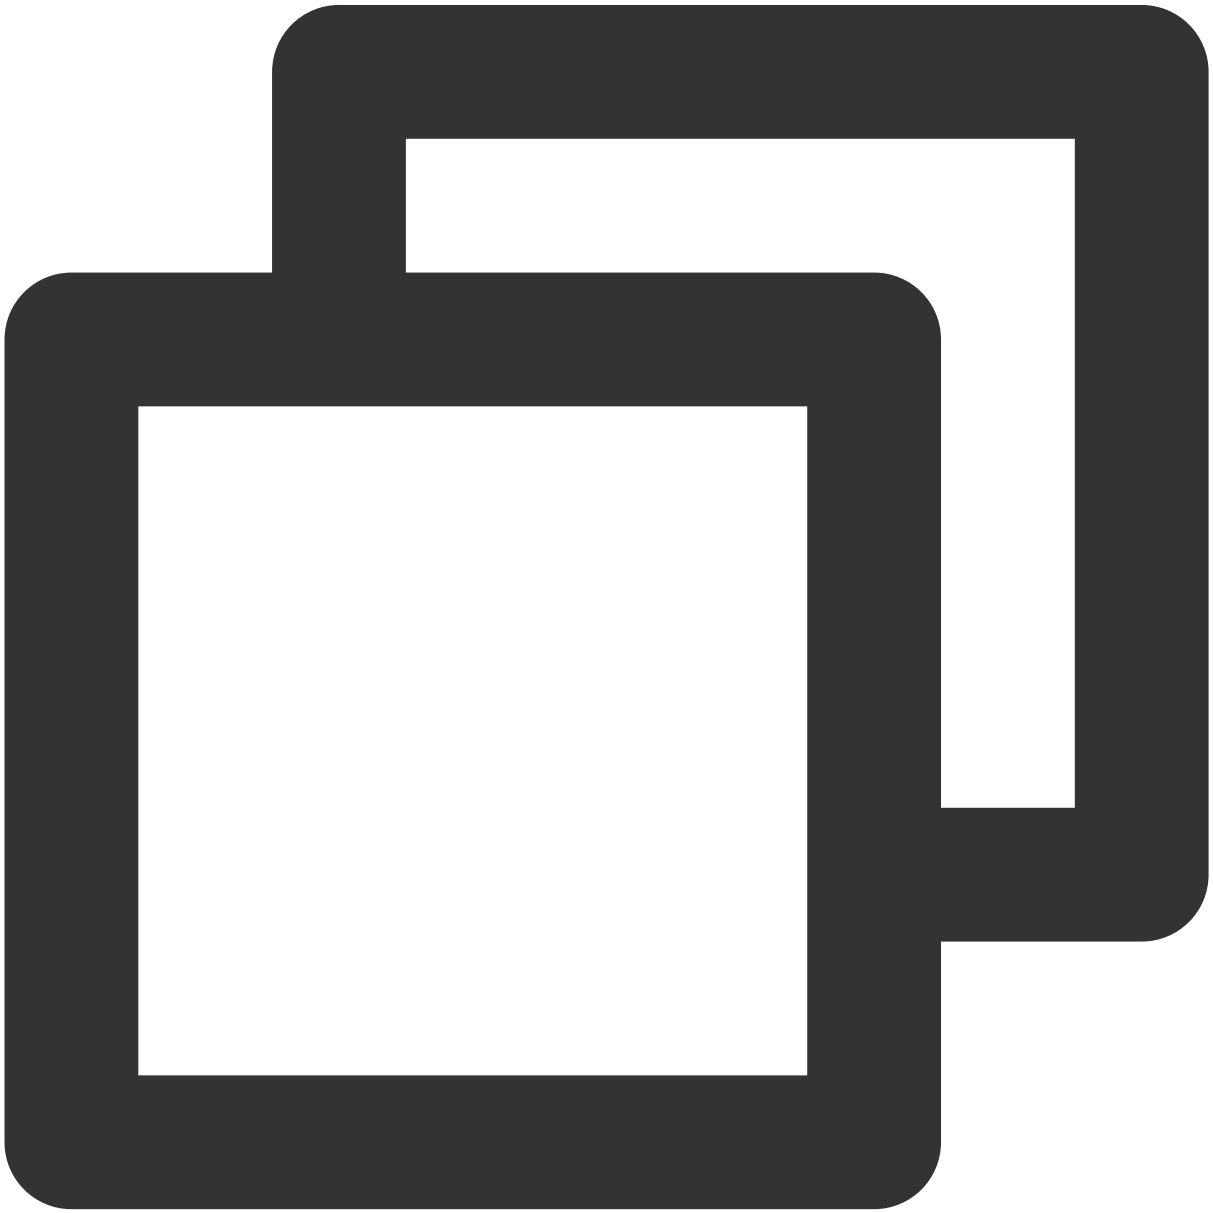
During the usage, some users might encounter the error: `java.lang.NoSuchMethodError: kotlin.collections.ArraysKt.copyInto` . This is due to the Kotlin runtime environment being of a lower version, and upgrading the Kotlin version might resolve the issue.

Failure to update dependencies in the repository's pom.xml file

This may be because the local server has a proxy configured, but the proxy is not configured for the tool during the update. Please update the dependencies on the command line as detailed above. If the problem persists, you need to check whether the problem is caused by network or firewall issues.

Failure to run the demo

In `[TencentCloudSDKException]message:java.net.ConnectException-Connection timed out: connect requestId:` , you need to check whether the local server has a proxy configured but the proxy is not added in the code. For more information, please see below:



```
HttpProfile httpProfile = new HttpProfile();
httpProfile.setProxyHost("actual proxy IP");
httpProfile.setProxyPort(real proxy port);
```

Version Upgrade

Please note that upgrading from v3.0.x to 3.1.x causes compatibility issues. As `integer` fields have been modified to `long` type, the project needs to be recompiled.

Certificate issue

Certificate issues are usually caused by incorrect configuration of the client environment. The SDK does not manipulate the certificate and relies on the processing by the Java runtime environment itself. After a certificate issue occurs, you can run `-Djavax.net.debug=ssl` to enable detailed logs for troubleshooting.

Some users reported that the certificate error `javax.net.ssl.SSLHandshakeException: Received fatal alert: handshake_failure` occurred while using IBM JDK 1.8. The error was resolved after Oracle JDK was used.

SDK for PHP

Last updated：2024-06-27 15:48:01

SDK 3.0 is a companion tool for the TencentCloud API 3.0 platform. You can use all SMS APIs through the SDK. The new SDK version is unified and features the same SDK usage, API call methods, error codes, and returned packet formats for different programming languages.

Note:

API version required for connecting to Tencent Cloud International:

SMS API v2021-01-11 is required. For details, see the sample code.

SMS sending APIs:

One message can be sent to up to 200 numbers at a time.

Signature and body template APIs:

Individual users have no permission to use signature and body template APIs and can manage SMS signatures and SMS body templates only in the SMS console. To use the APIs, change "Individual Identity" to "Organizational Identity".

Prerequisites

You have learned about the concept of region and selected a region as needed.

You have activated SMS. For detailed directions, please see Getting Started.

You have obtained the `SecretID` and `SecretKey` on the API Key Management page in the CAM console.

`SecretID` is used to identify the API caller.

`SecretKey` is used to encrypt the string to sign that can be verified on the server. **You should keep it private and avoid disclosure.**

The endpoint of the SMS service is `sms.tencentcloudapi.com`.

Relevant Documents

For more information on the APIs and their parameters, please see API Documentation.

You can download the SDK source code from Github Repository.

Installing SDK

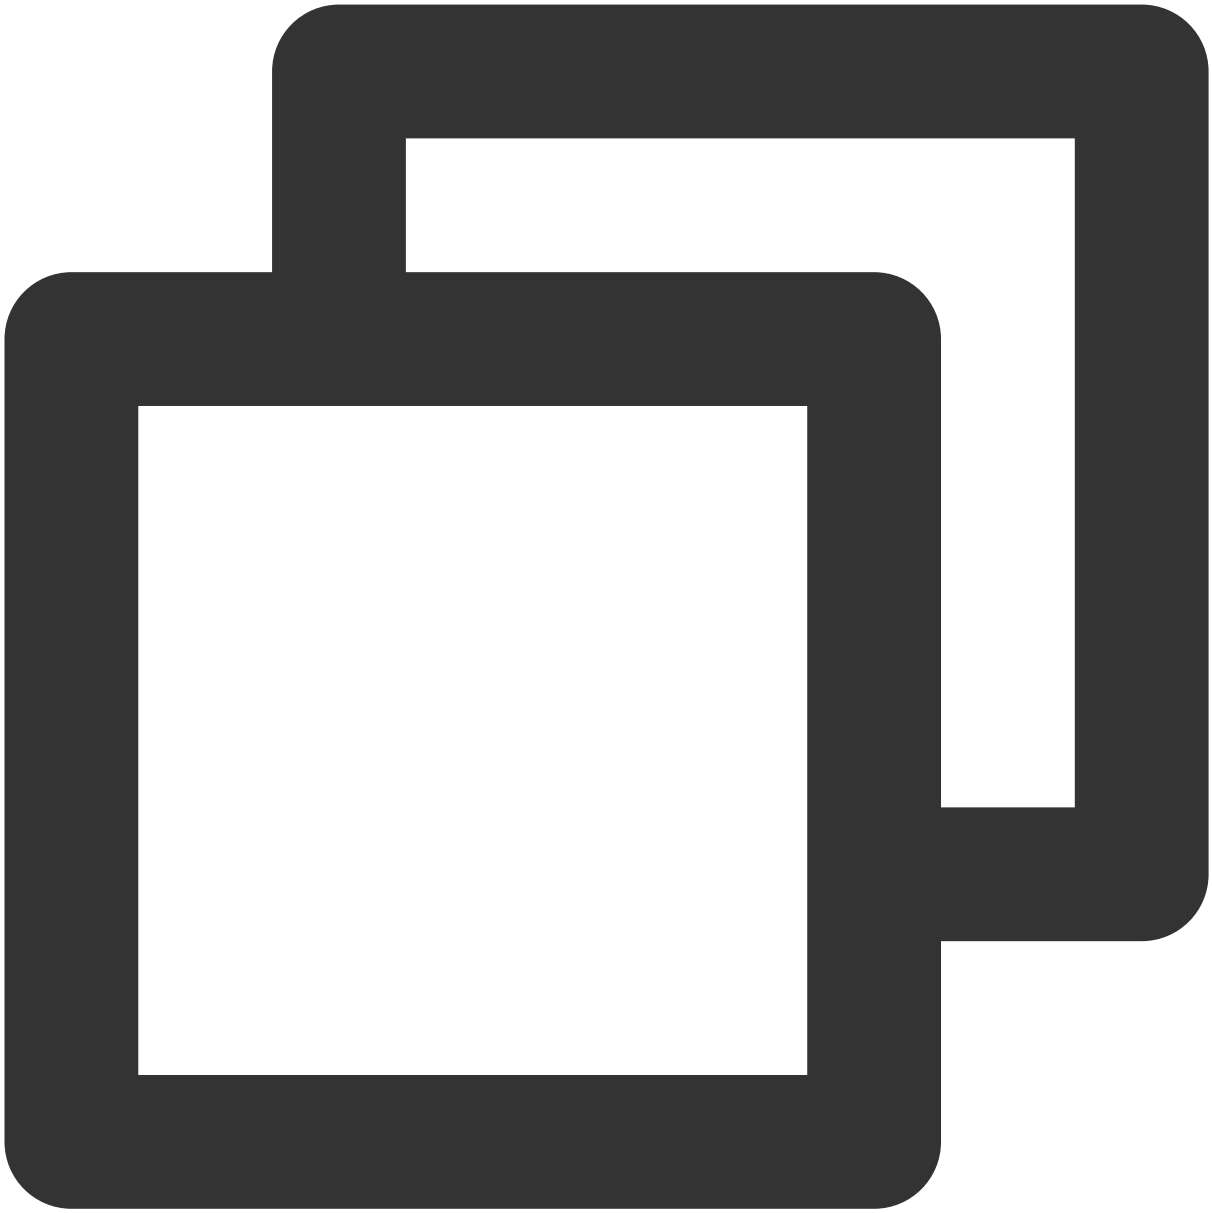
Installing via Composer

See Github repository:Installing via Composer

Sample Code

Note:
All samples are for reference only and cannot be directly compiled and executed. You need to modify them based on your actual needs. You can also use API 3.0 Explorer to automatically generate the demo code as needed.
Each API has a corresponding request structure and a response structure. This document only lists the sample code of several common features as shown below:

Sending SMS message



```
<?php
require_once '/path/to/vendor/autoload.php';
// Import the client of the corresponding product module
use TencentCloud\\Sms\\V20210111\\SmsClient;
// Import the `Request` class corresponding to the request API
use TencentCloud\\Sms\\V20210111\\Models\\SendSmsRequest;
use TencentCloud\\Common\\Exception\\TencentCloudSDKException;
use TencentCloud\\Common\\Credential;
// Import the optional configuration classes
use TencentCloud\\Common\\Profile\\ClientProfile;
use TencentCloud\\Common\\Profile\\HttpProfile;
```

```
try {
    // Instantiate a certificate object. The input parameters require the Tencent C
    // To protect key security, it is suggested to set keys in environment variable
    // Hardcoding keys into the code might lead to exposure through leaked code, po
    // For SecretId, SecretKey lookup: https://console.intl.cloud.tencent.com/cam/c
    // $cred = new Credential("SecretId", "SecretKey");
    $cred = new Credential(getenv("TENCENTCLOUD_SECRET_ID"),
                           getenv("TENCENTCLOUD_SECRET_KEY"));

    // (Optional) Instantiate an HTTP option
    $httpProfile = new HttpProfile();
    // Configure the proxy
    // $httpProfile->setProxy("https://ip:port");
    $httpProfile->setReqMethod("GET");  // GET request (POST request by default)
    $httpProfile->setReqTimeout(10);    // Request timeout period in seconds (60 se
    $httpProfile->setEndpoint("sms.tencentcloudapi.com");  // Specify the access re

    // Instantiate a client option (optional; skip if no special requirements are p
    $clientProfile = new ClientProfile();
    $clientProfile->setSignMethod("TC3-HMAC-SHA256");  // Specify the signature alg
    $clientProfile->setHttpProfile($httpProfile);

    // Instantiate the client object of the requested product (with SMS as an examp
    // The second parameter is the information on the region you select in Tencent
    $client = new SmsClient($cred, "ap-singapore", $clientProfile);

    // Instantiate an SMS message sending request object. Each API corresponds to a
    $req = new SendSmsRequest();

    /* Populate the request parameters. Here, the member variables of the request o
     * You can view the definition of the request parameters in the API documentati
     * Settings of a basic parameter:
     * Help link:
     * SMS console: https://console.intl.cloud.tencent.com/smsv2
     * sms helper: https://intl.cloud.tencent.com/document/product/382/3773 */

    /* SMS application ID, which is the `SdkAppId` generated after an application i
    $req->SmsSdkAppId = "2400006666";
    /* SMS signature content, which should be encoded in UTF-8. You must enter an a
    $req->SignName = "xxx";
    /* SMS code number extension, which is not activated by default. If you need to
    $req->ExtendCode = "";
    /* Target mobile number in the E.164 standard (+[country/region code][mobile nu
     * Example: +60198890000, which has a + sign followed by 60 (country/region cod
    $req->PhoneNumberSet = array("+60198890000");
    /* `SenderId` for Global SMS, which is not activated by default. If you need to
```

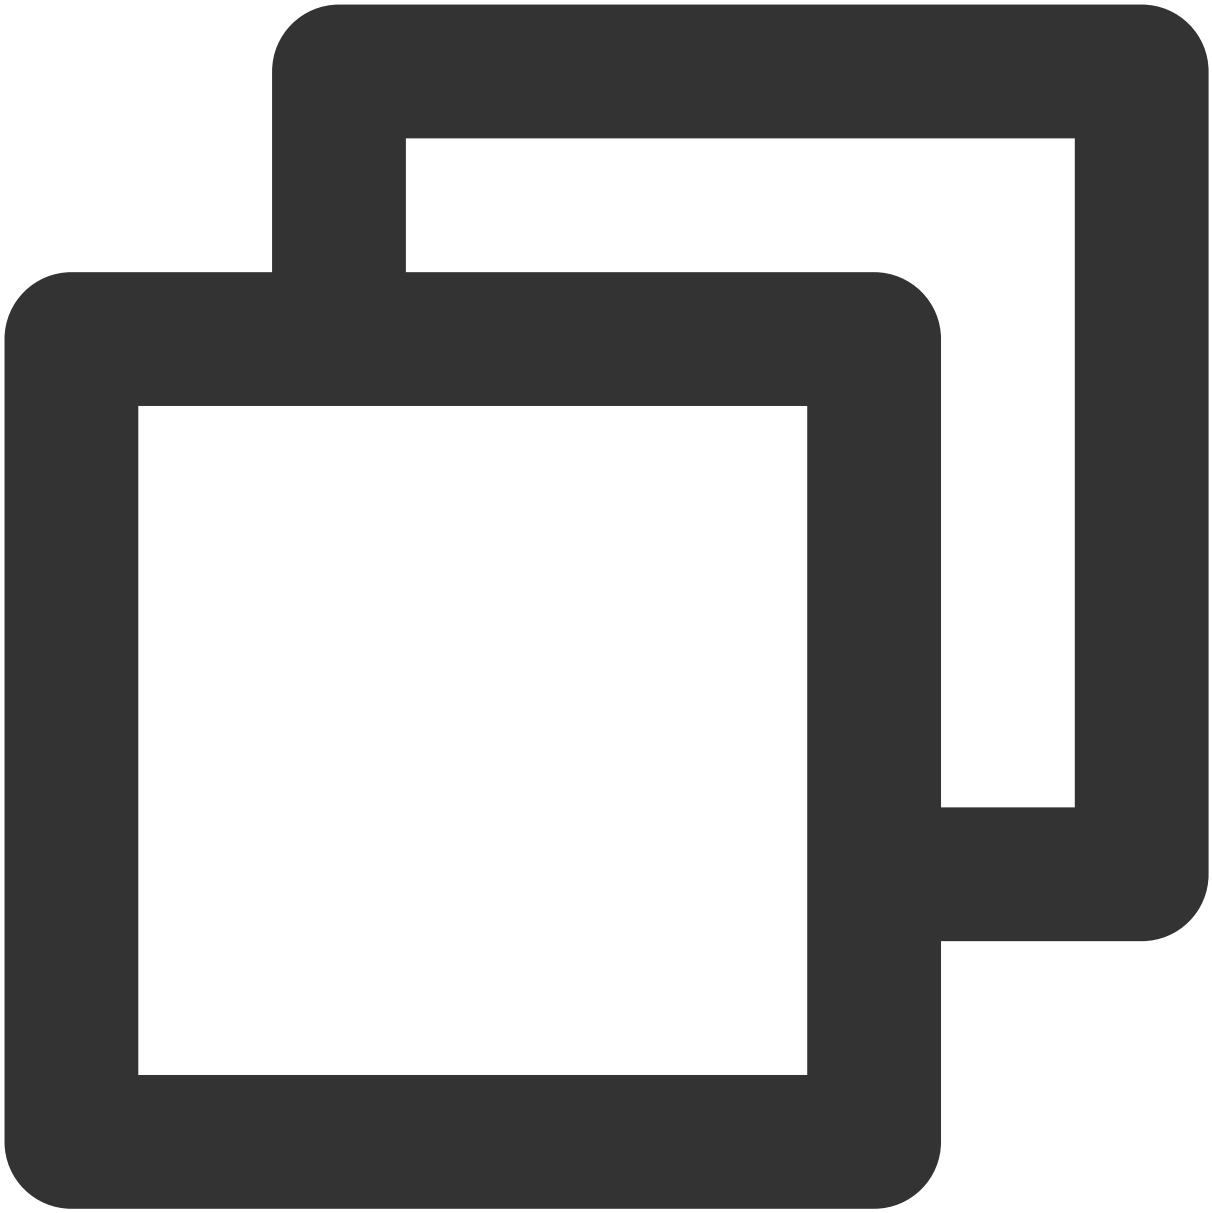
```
    $req->SenderId = "";
    /* User session content, which can carry context information such as user-side
    $req->SessionContext = "xxx";
    /* Template ID. You must enter the ID of an approved template, which can be vie
    $req->TemplateId = "449739";
    /* Template parameters. If there are no template parameters, leave it empty */
    $req->TemplateParamSet = array("0");

    // Initialize the request by calling the `SendSms` method on the client object.
    // The returned `resp` is an instance of the `SendSmsResponse` class which corr
    $resp = $client->SendSms($req);

    // A string return packet in JSON format is output
    print_r($resp->toJsonString());

    // You can also take a single value
    // You can view the definition of the return field in the API documentation at
    print_r($resp->TotalCount);
}
catch(TencentCloudSDKException $e) {
    echo $e;
}
```

Pulling receipt status



```
<?php
require_once '/path/to/vendor/autoload.php';
// Import the client of the corresponding product module
use TencentCloud\\Sms\\V20210111\\SmsClient;
// Import the `Request` class corresponding to the request API
use TencentCloud\\Sms\\V20210111\\Models\\PullSmsSendStatusRequest;
use TencentCloud\\Common\\Exception\\TencentCloudSDKException;
use TencentCloud\\Common\\Credential;
// Import the optional configuration classes
use TencentCloud\\Common\\Profile\\ClientProfile;
use TencentCloud\\Common\\Profile\\HttpProfile;
```

```
try {
    // Instantiate a certificate object. The input parameters require the Tencent C
    // To protect key security, it is suggested to set keys in environment variable
    // Hardcoding keys into the code might lead to exposure through leaked code, po
    // For SecretId, SecretKey lookup: https://console.intl.cloud.tencent.com/cam/c
    // $cred = new Credential("SecretId", "SecretKey");
    $cred = new Credential(getenv("TENCENTCLOUD_SECRET_ID"),
                           getenv("TENCENTCLOUD_SECRET_KEY"));

    // (Optional) Instantiate an HTTP option
    $httpProfile = new HttpProfile();
    // Configure the proxy
    // $httpProfile->setProxy("https://ip:port");
    $httpProfile->setReqMethod("GET");  // GET request (POST request by default)
    $httpProfile->setReqTimeout(30);    // Request timeout period in seconds (60 se
    $httpProfile->setEndpoint("sms.tencentcloudapi.com");  // Specify the access re

    // Instantiate a client option (optional; skip if no special requirements are p
    $clientProfile = new ClientProfile();
    $clientProfile->setSignMethod("TC3-HMAC-SHA256");  // Specify the signature alg
    $clientProfile->setHttpProfile($httpProfile);

    // Instantiate the client object of the requested product (with SMS as an examp
    // The second parameter is the information on the region you select in Tencent
    $client = new SmsClient($cred, "ap-singapore", $clientProfile);

    // Instantiate an SMS message sending request object. Each API corresponds to a
    $req = new PullSmsSendStatusRequest();

    /* Populate the request parameters. Here, the member variables of the request o
     * You can view the definition of the request parameters in the API documentati
     * Settings of a basic parameter:
     * Help link:
     * SMS console: https://console.intl.cloud.tencent.com/smsv2
     * sms helper: https://intl.cloud.tencent.com/document/product/382/3773 */

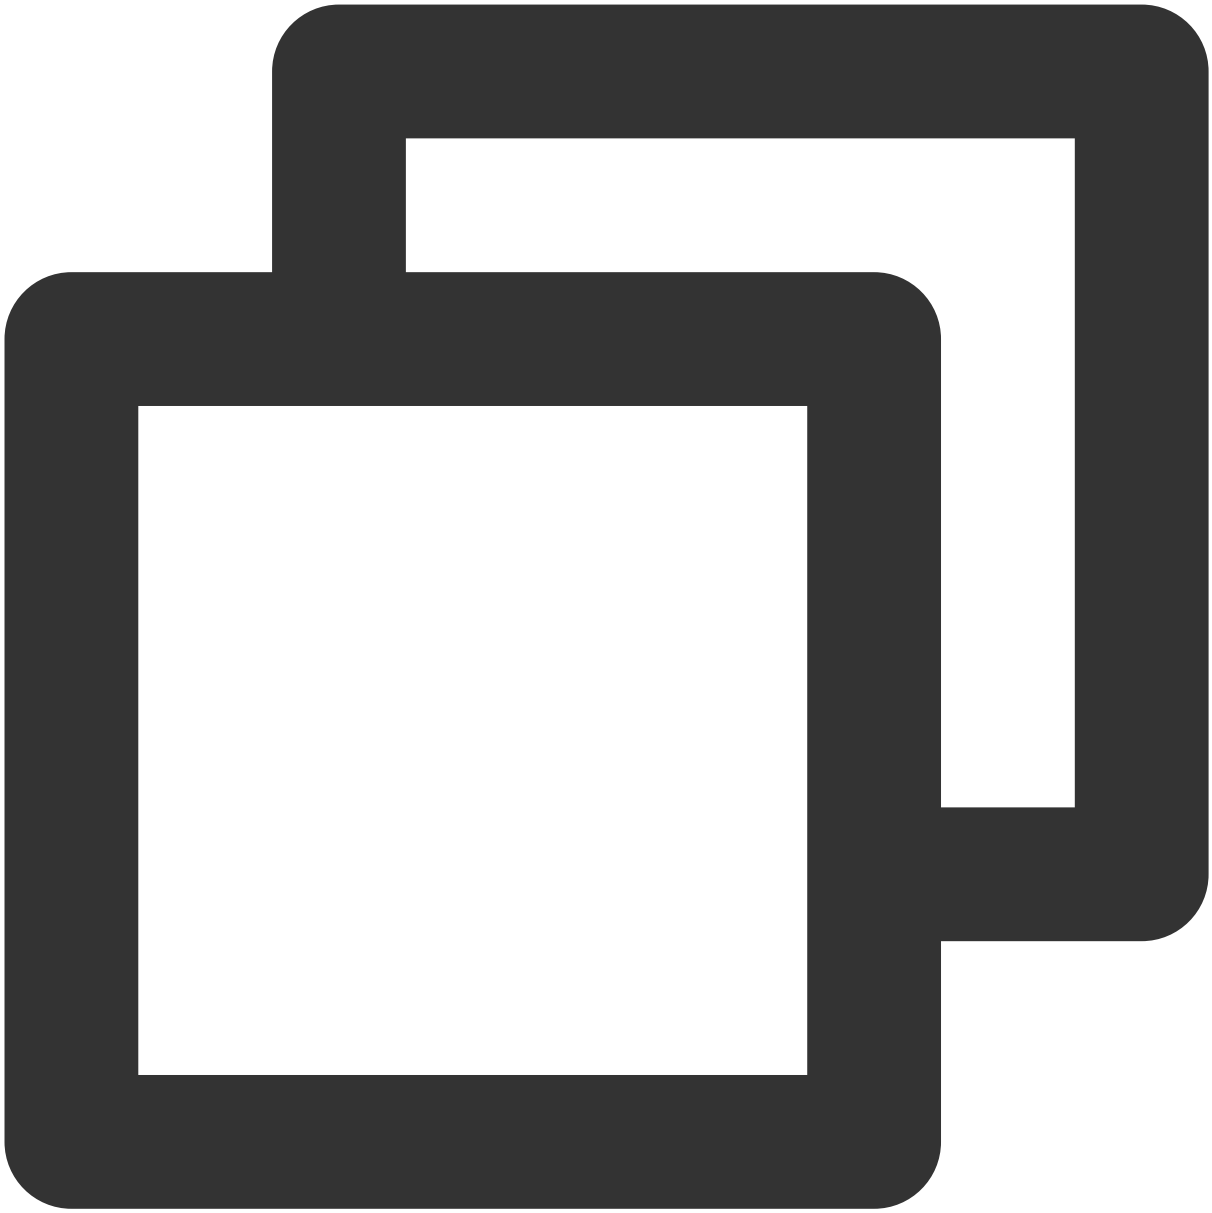
    /* SMS application ID, which is the `SdkAppId` generated after an application i
    $req->SmsSdkAppId = "2400006666";
    /* Maximum number of pulled entries. Maximum value: 100 */
    $req->Limit = 10;

    // Initialize the request by calling the `PullSmsSendStatus` method on the clie
    // The returned `resp` is an instance of the `PullSmsSendStatusResponse` class
    $resp = $client->PullSmsSendStatus($req);
```

```
    // A string return packet in JSON format is output
    print_r($resp->toJsonString());

    // You can also take a single value
    // You can view the definition of the return field in the API documentation at
    print_r($resp->TotalCount);
}
catch(TencentCloudSDKException $e) {
    echo $e;
}
```

Collecting SMS message sending data



```
<?php
require_once '/path/to/vendor/autoload.php';
// Import the client of the corresponding product module
use TencentCloud\\Sms\\V20210111\\SmsClient;
// Import the `Request` class corresponding to the request API
use TencentCloud\\Sms\\V20210111\\Models\\SendStatusStatisticsRequest;
use TencentCloud\\Common\\Exception\\TencentCloudSDKException;
use TencentCloud\\Common\\Credential;
// Import the optional configuration classes
use TencentCloud\\Common\\Profile\\ClientProfile;
use TencentCloud\\Common\\Profile\\HttpProfile;
```

```
try {
    // Instantiate a certificate object. The input parameters require the Tencent C
    // To protect key security, it is suggested to set keys in environment variable
    // Hardcoding keys into the code might lead to exposure through leaked code, po
    // For SecretId, SecretKey lookup: https://console.intl.cloud.tencent.com/cam/c
    // $cred = new Credential("SecretId", "SecretKey");
    $cred = new Credential(getenv("TENCENTCLOUD_SECRET_ID"),
                           getenv("TENCENTCLOUD_SECRET_KEY"));

    // (Optional) Instantiate an HTTP option
    $httpProfile = new HttpProfile();
    // Configure the proxy
    // $httpProfile->setProxy("https://ip:port");
    $httpProfile->setReqMethod("GET");  // GET request (POST request by default)
    $httpProfile->setReqTimeout(30);    // Request timeout period in seconds (60 se
    $httpProfile->setEndpoint("sms.tencentcloudapi.com");  // Specify the access re

    // Instantiate a client option (optional; skip if no special requirements are p
    $clientProfile = new ClientProfile();
    $clientProfile->setSignMethod("TC3-HMAC-SHA256");  // Specify the signature alg
    $clientProfile->setHttpProfile($httpProfile);

    // Instantiate the client object of the requested product (with SMS as an examp
    // The second parameter is the information on the region you select in Tencent
    $client = new SmsClient($cred, "ap-singapore", $clientProfile);

    // Instantiate an SMS message sending request object. Each API corresponds to a
    $req = new SendStatusStatisticsRequest();

    /* Populate the request parameters. Here, the member variables of the request o
     * You can view the definition of the request parameters in the API documentati

}
```

FAQs

Certificate issue

If there is a problem with your PHP environment certificate, errors similar to `cURL error 60: See http://curl.haxx.se/libcurl/c/libcurl-errors.html` may occur, which can be solved as follows:

1. Download the certificate file `cacert.pem` at https://curl.haxx.se/ca/cacert.pem and save it to the PHP installation path.
2. Edit the `php.ini` file: delete the semicolon comment (;) before the `curl.cainfo` configuration item and set the value to the absolute path of the saved certificate file `cacert.pem`.
3. Restart the services that depend on PHP.

php_curl extension

GuzzleHttp, which this SDK depends on, needs to have the php_curl extension enabled. Check whether the php.ini environment in your environment is enabled. For example, on Linux with PHP 7.1, for services hosted under Apache, you can open `/etc/php/7.1/apache2/php.ini` to see whether the `extension=php_curl.dll` configuration item has been commented. Please delete the comment before it and restart Apache.

Web access exception

The command is executed normally on the command line, but when it is executed on the web server, the following error is reported:

`cURL error 0: The cURL request was retried 3 times and did not succeed. The most likely reason for the failure is that cURL was unable to rewind the body of the request and subsequent retries resulted in the same error. Turn on the debug option to see what went wrong. See https://bugs.php.net/bug.php?id=47204 for more information. (see http://curl.haxx.se/libcurl/c/libcurl-errors.html)`

This error may occur in different cases. You can run `php -r "echo sys_get_temp_dir();"` to print the absolute path of the default system temporary directory and set `sys_temp_dir` in `php.ini` to this value, and then check whether this error is fixed.

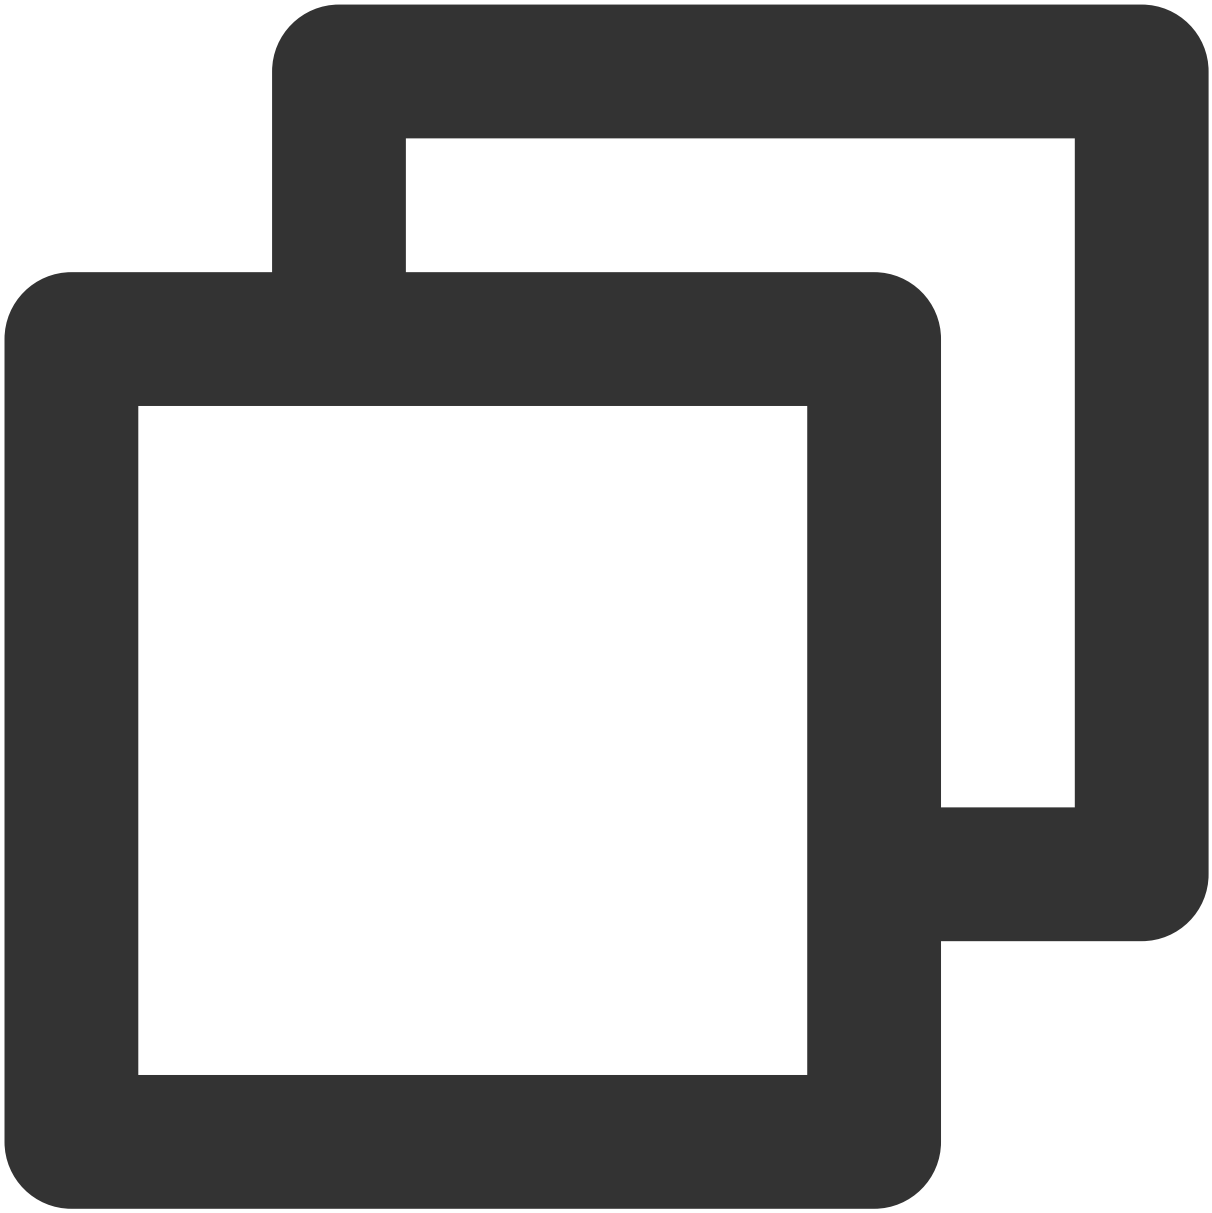
Problem with installation through source code

In order to satisfy the need for installation through source code, we previously put the dependent package files in the `vendor` directory. However, considering that incompatibility with Composer should not be caused, we had to forbid importing the `vendor` directory on GitHub, which resulted in the problem where the `git clone` command had to be used to get the `vendor` directory. This practice caused confusion for some users not familiar with GitHub. Therefore, starting from v3.0.188, we have temporarily removed the method of installation through source code, and Composer must be used to install the SDK and dependent packages.

Proxy settings

If there is a proxy in your environment, you need to set the system environment variable `https_proxy`; otherwise, it may not be called normally, and a connection timeout exception will be thrown.

You can also use `GuzzleHttp` to configure the proxy:



```
$cred = new Credential("secretId", "secretKey");

$httpProfile = new HttpProfile();
$httpProfile->setProxy('https://ip:port');

$clientProfile = new ClientProfile();
$clientProfile->setHttpProfile($httpProfile);
```

SDK for Python

Last updated：2024-06-27 15:48:00

SDK 3.0 is a companion tool for the TencentCloud API 3.0 platform. You can use all SMS APIs through the SDK. The new SDK version is unified and features the same SDK usage, API call methods, error codes, and returned packet formats for different programming languages.

Note:

API version required for connecting to Tencent Cloud International:

SMS API v2021-01-11 is required. For details, see the sample code.

SMS sending APIs:

One message can be sent to up to 200 numbers at a time.

Signature and body template APIs:

Individual users have no permission to use signature and body template APIs and can manage SMS signatures and SMS body templates only in the SMS console. To use the APIs, change "Individual Identity" to "Organizational Identity".

Prerequisites

You have learned about the concept of region and selected a region as needed.

You have activated SMS. For detailed directions, please see Getting Started.

You have obtained the `SecretID` and `SecretKey` on the API Key Management page in the CAM console.

`SecretID` is used to identify the API caller.

`SecretKey` is used to encrypt the string to sign that can be verified on the server. **You should keep it private and avoid disclosure.**

The endpoint of the SMS service is `sms.tencentcloudapi.com`.

Relevant Documents

For more information on the APIs and their parameters, please see API Documentation.

You can download the SDK source code from Github Repository.

FAQs

Certificate issue

When you install Python 3.6 or above on macOS, you may encounter a certificate error: `Error: [SSL: CERTIFICATE_VERIFY_FAILED] certificate verify failed: self signed certificate in certificate chain (_ssl.c:1056).`

This is because that on macOS, Python no longer uses the system's default certificate and does not provide a certificate itself. When an HTTPS request is made, the certificate provided by the `certifi` library needs to be used, but the SDK does not support specifying it; therefore, you can only solve this problem by installing the certificate with the `sudo "/Applications/Python 3.6/Install Certificates.command"` command.

Although this problem should not occur in Python 2, there may be similar situations in specific user environments, which can also be solved with `sudo /Applications/Python 2.7/Install Certificates.command` .

Proxy settings

If there is a proxy in your environment, you can set the proxy in the following two ways:

Specify the proxy when initializing HttpProfile. For more information, please see the example.

You need to set the system environment variable `https_proxy` .

Otherwise, it may not be called normally, and a connection timeout exception will be thrown.

SDK for Node.js

Last updated：2024-06-27 15:48:00

SDK 3.0 is a companion tool for the TencentCloud API 3.0 platform. You can use all SMS APIs through the SDK. The new SDK version is unified and features the same SDK usage, API call methods, error codes, and returned packet formats for different programming languages.

Note:

API version required for connecting to Tencent Cloud International:

SMS API v2021-01-11 is required. For details, see the sample code.

SMS sending APIs:

One message can be sent to up to 200 numbers at a time.

Signature and body template APIs:

Individual users have no permission to use signature and body template APIs and can manage SMS signatures and SMS body templates only in the SMS console. To use the APIs, change "Individual Identity" to "Organizational Identity".

Prerequisites

You have learned about the concept of region and selected a region as needed.

You have activated SMS. For detailed directions, please see Getting Started.

You have obtained the `SecretID` and `SecretKey` on the API Key Management page in the CAM console.

`SecretID` is used to identify the API caller.

`SecretKey` is used to encrypt the string to sign that can be verified on the server. **You should keep it private and avoid disclosure.**

The endpoint of the SMS service is `sms.tencentcloudapi.com`.

Relevant Documents

For more information on the APIs and their parameters, please see API Documentation.

You can download the SDK source code from Github Repository.

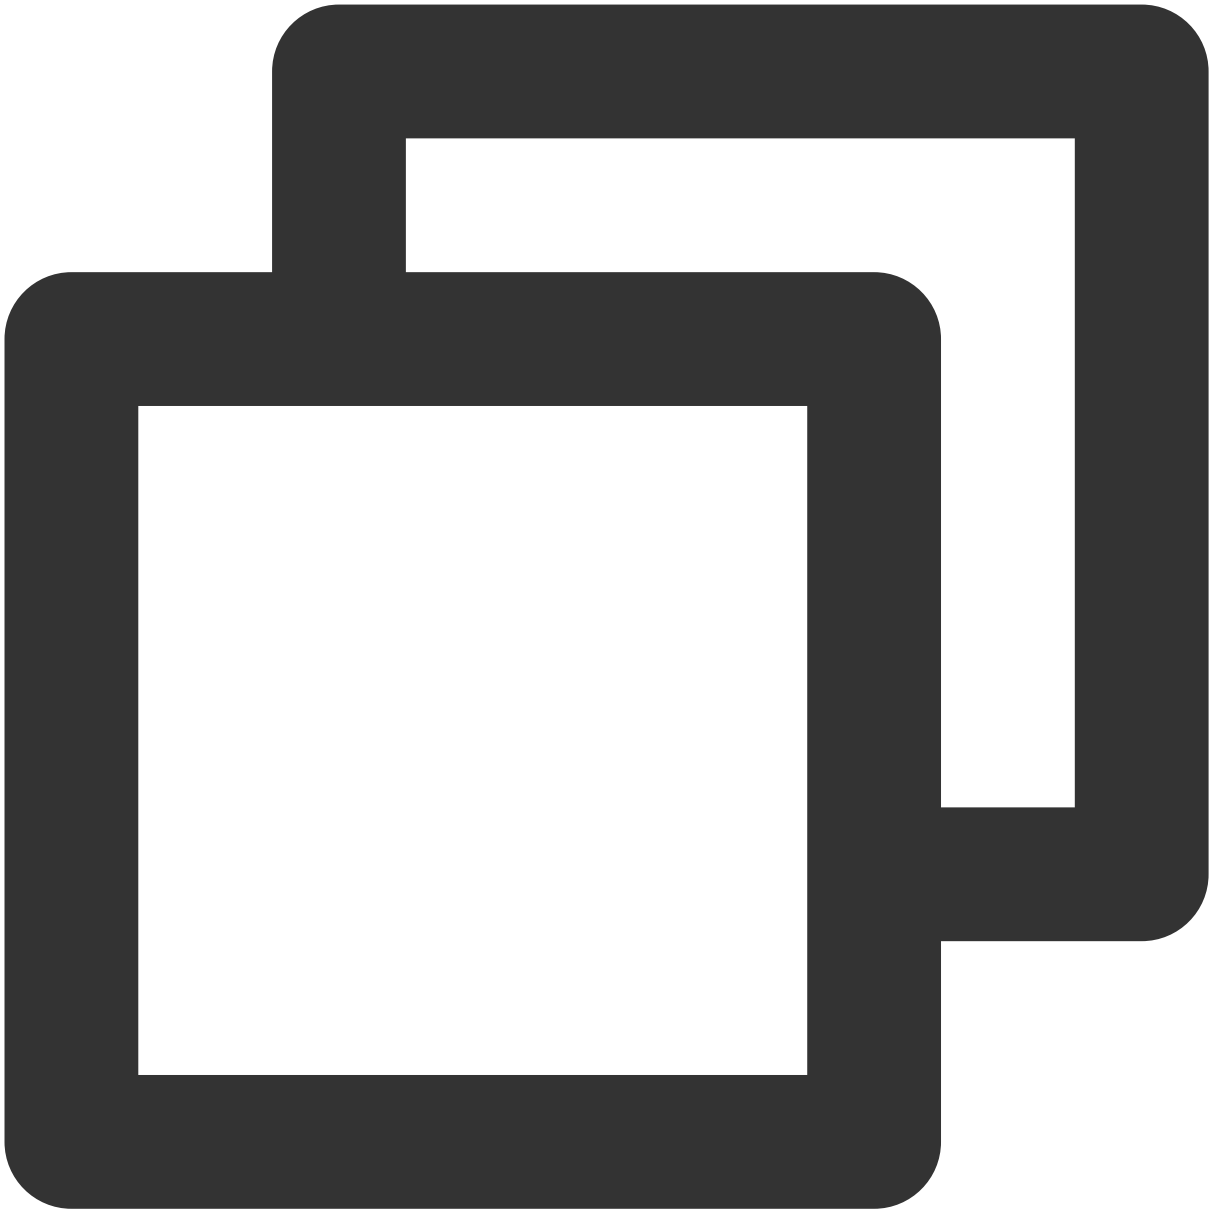
Sample Code

Note:
All samples are for reference only and cannot be directly compiled and executed. You need to modify them based on your actual needs. You can also use API 3.0 Explorer to automatically generate the demo code as needed.
Each API has a corresponding request structure and a response structure. This document only lists the sample code of several common features as shown below:

Sending SMS message



```
const tencentcloud = require("tencentcloud-sdk-nodejs")

// Import the client models of the corresponding product module
const smsClient = tencentcloud.sms.v20210111.Client

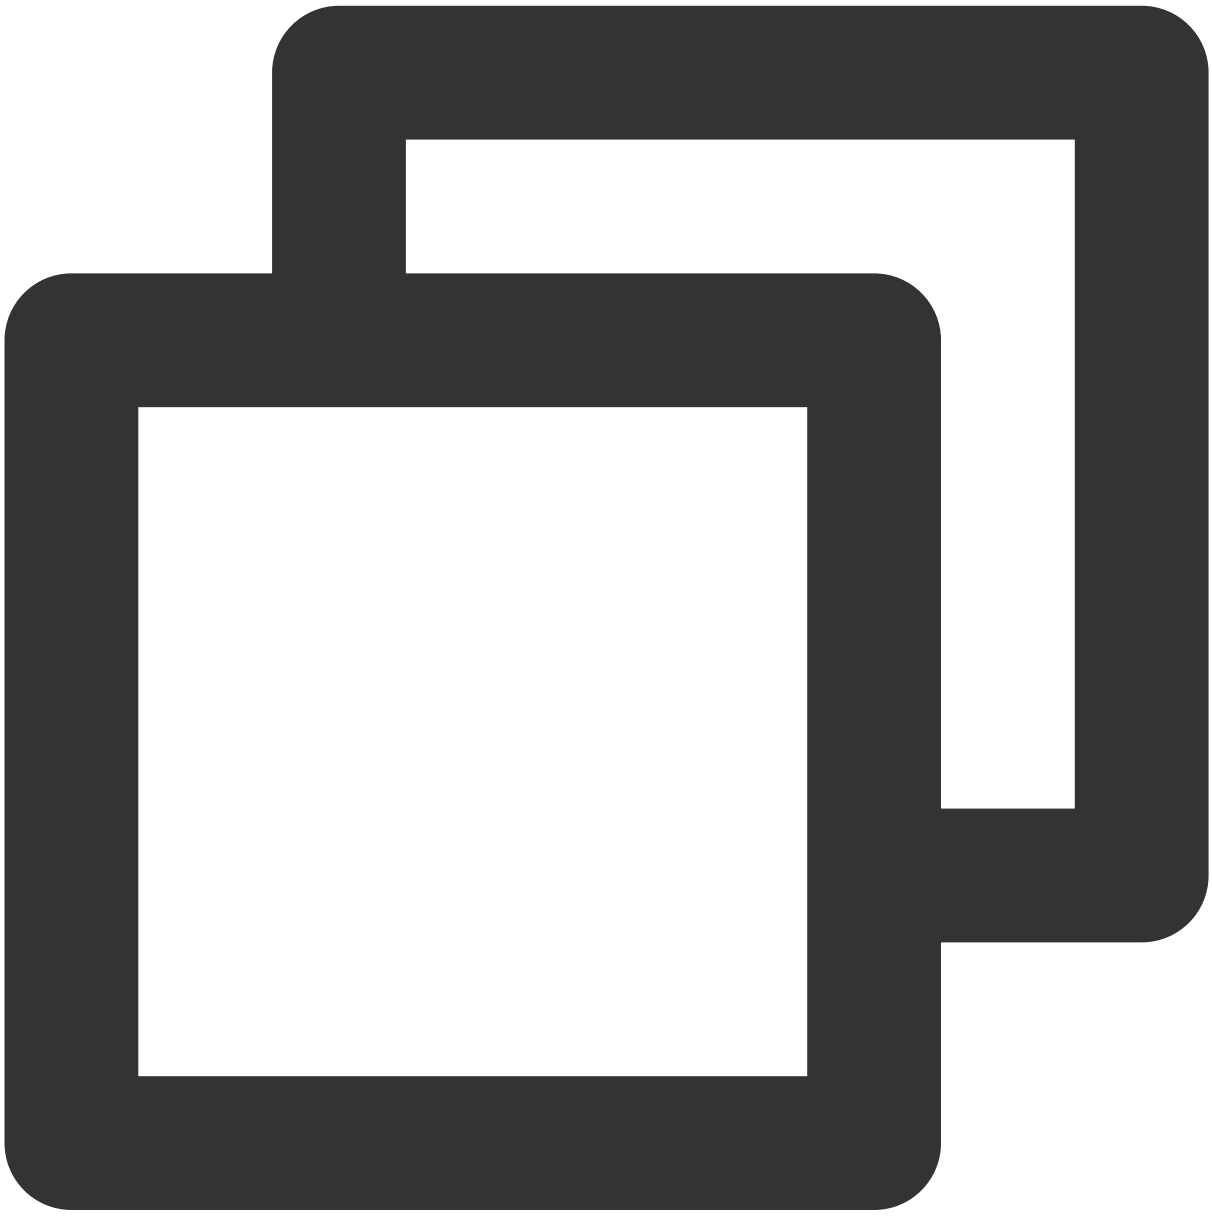
/* Instantiate the client object of the requested product (with SMS as an example)
const client = new smsClient({
  credential: {
    /* To protect key security, it is suggested to set keys in environment variable
    * Hardcoding keys into the code might lead to exposure through leaked code, pos
    * Query the CAM Key: https://console.intl.cloud.tencent.com/cam/capi */
```

```
    secretId: process.env.TENCENTCLOUD_SECRET_ID,
    secretKey: process.env.TENCENTCLOUD_SECRET_KEY,
  },
  /* Required: region information. The parameter is the information on the region y
  region: "ap-singapore",
  /* Optional:
   * Client configuration object. You can specify the timeout period and other conf
  profile: {
    /* The SDK uses `TC3-HMAC-SHA256` to sign by default. Do not modify this field
    signMethod: "HmacSHA256",
    httpProfile: {
      reqMethod: "POST", // Request Method
      reqTimeout: 10, // Request timeout time, in seconds (the default value is 60
      endpoint: "sms.tencentcloudapi.com"
    },
  },
})

/* Request parameter. You can further set the request parameters according to the A
 * An attribute may be of a basic type or import another data structure
 * We recommend you use the IDE for development where you can easily redirect to an
const params = {
  /* SMS application ID, which is the `SdkAppId` generated after an application is
  SmsSdkAppId: "2400006666",
  /* SMS signature content, which should be encoded in UTF-8. You must enter an app
  SignName: "xxx",
  /* SMS code number extension, which is not activated by default. If you need to a
  ExtendCode: "",
  /* `senderid` for Global SMS, which is not activated by default. If you need to a
  SenderId: "",
  /* User session content, which can carry context information such as user-side ID
  SessionContext: "",
  /* Target mobile number in the e.164 standard (+[country/region code][mobile numb
   * Example: +60198890000, which has a + sign followed by 60 (country/region code)
  PhoneNumberSet: ["+60198890000"],
  /* Template ID. You must enter the ID of an approved template, which can be viewe
  TemplateId: "449739",
  /* Template parameters. If there are no template parameters, leave it empty */
  TemplateParamSet: ["666"],
}
// Call the API you want to access through the client object; you need to pass in t
client.SendSms(params, function (err, response) {
  // The request returns an exception and the exception information is printed
  if (err) {
    console.log(err)
    return
  }
```

```
  // The request is returned normally, and the `response` object is printed
  console.log(response)
})
```

Pulling receipt status



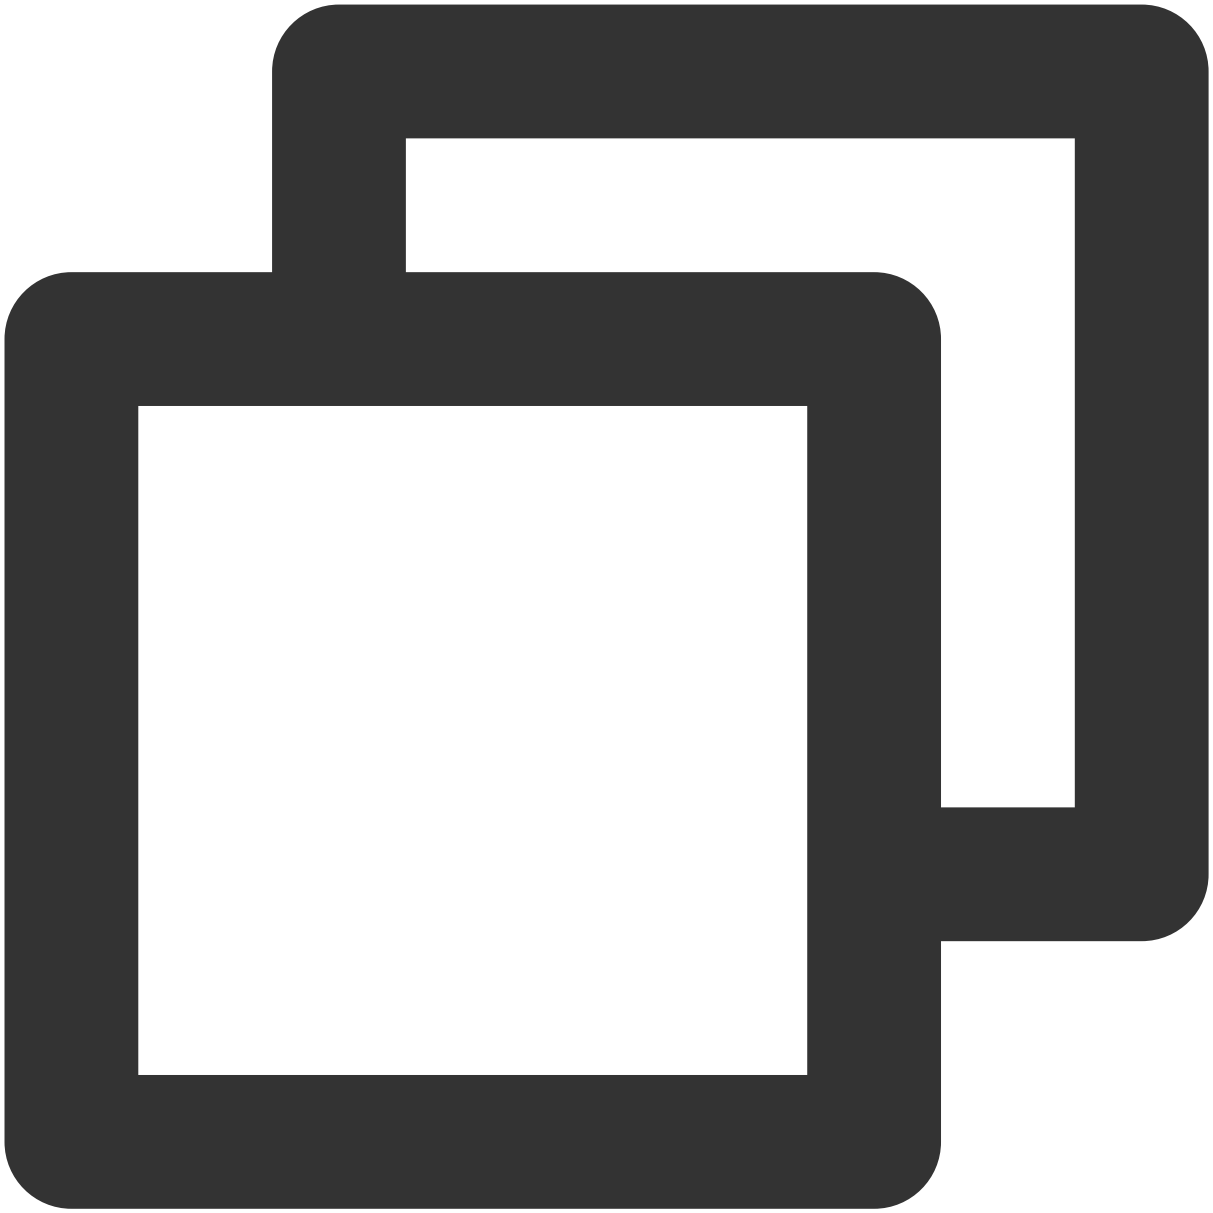
```
const tencentcloud = require("tencentcloud-sdk-nodejs")

// Import the client models of the corresponding product module
const smsClient = tencentcloud.sms.v20210111.Client
```

```
/* Instantiate the client object of the requested product (with SMS as an example)
const client = new smsClient({
  credential: {
    /* To protect key security, it is suggested to set keys in environment variable
    * Hardcoding keys into the code might lead to exposure through leaked code, pos
    * Query the CAM Key: https://console.intl.cloud.tencent.com/cam/capi */
    secretId: process.env.TENCENTCLOUD_SECRET_ID,
    secretKey: process.env.TENCENTCLOUD_SECRET_KEY,
  },
  /* Required: region information. The parameter is the information on the region y
  region: "ap-singapore",
  /* Optional:
   * Client configuration object. You can specify the timeout period and other conf
  profile: {
    /* The SDK uses `TC3-HMAC-SHA256` to sign by default. Do not modify this field
    signMethod: "HmacSHA256",
    httpProfile: {
      reqMethod: "POST", // Request Method
      reqTimeout: 30, // Request timeout time, in seconds (the default value is 60
      endpoint: "sms.tencentcloudapi.com"
    },
  },
})

/* Request parameter. You can further set the request parameters according to the A
 * An attribute may be of a basic type or import another data structure
 * We recommend you use the IDE for development where you can easily redirect to an
const params = {
  // SMS application ID, which is the `SdkAppId` generated after an application is
  SmsSdkAppId: "2400006666",
  // Maximum number of pulled entries. Maximum value: 100
  Limit: 10,
}
// Call the API you want to access through the client object; you need to pass in t
client.PullSmsSendStatus(params, function (err, response) {
  // The request returns an exception and the exception information is printed
  if (err) {
    console.log(err)
    return
  }
  // The request is returned normally, and the `response` object is printed
  console.log(response)
})
```

Collecting SMS message sending data



```
const tencentcloud = require("tencentcloud-sdk-nodejs")

// Import the client models of the corresponding product module
const smsClient = tencentcloud.sms.v20210111.Client

/* Instantiate the client object of the requested product (with SMS as an example)
const client = new smsClient({
  credential: {
    /* To protect key security, it is suggested to set keys in environment variable
    * Hardcoding keys into the code might lead to exposure through leaked code, pos
    * Query the CAM Key: https://console.intl.cloud.tencent.com/cam/capi */
```

```
    secretId: process.env.TENCENTCLOUD_SECRET_ID,
    secretKey: process.env.TENCENTCLOUD_SECRET_KEY,
  },
  /* Required: region information. The parameter is the information on the region y
  region: "ap-singapore",
  /* Optional:
   * Client configuration object. You can specify the timeout period and other conf
  profile: {
    /* The SDK uses `TC3-HMAC-SHA256` to sign by default. Do not modify this field
    signMethod: "HmacSHA256",
    httpProfile: {
      reqMethod: "POST", // Request Method
      reqTimeout: 30, // Request timeout time, in seconds (the default value is 60
      endpoint: "sms.tencentcloudapi.com"
    },
  },
})

/* Request parameter. You can further set the request parameters according to the A
 * An attribute may be of a basic type or import another data structure
 * We recommend you use the IDE for development where you can easily redirect to an
const params = {
    // SMS application ID, which is the `SdkAppId` generated after an application i
    SmsSdkAppId: "2400006666",
    // Maximum number of pulled entries. Maximum value: 100
    Limit: 10,
    // Offset. Note: this parameter is currently fixed at 0
    Offset: 0,
    // Start time of pull in the format of `yyyymmddhh` accurate to the hour

  International: 0,
  /* Template remarks, such as reason for application and use case */
  Remark: "xxx",
}
// Call the API you want to access through the client object; you need to pass in t
client.AddSmsTemplate(params, function (err, response) {
  // The request returns an exception and the exception information is printed
  if (err) {
    console.log(err)
    return
  }
  // The request is returned normally, and the `response` object is printed
  console.log(response)
})
```

FAQs

Proxy settings

If there is a proxy in your environment, you need to set the system environment variable `https_proxy` ; otherwise, it may not be called normally, and a connection timeout exception will be thrown.

SDK for C#

Last updated：2024-06-27 15:48:01

SDK 3.0 is a companion tool for the TencentCloud API 3.0 platform. You can use all SMS APIs through the SDK. The new SDK version is unified and features the same SDK usage, API call methods, error codes, and returned packet formats for different programming languages.

Note:

API version required for connecting to Tencent Cloud International:

SMS API v2021-01-11 is required. For details, see the sample code.

SMS sending APIs:

One message can be sent to up to 200 numbers at a time.

Signature and body template APIs:

Individual users have no permission to use signature and body template APIs and can manage SMS signatures and SMS body templates only in the SMS console. To use the APIs, change "Individual Identity" to "Organizational Identity".

Prerequisites

You have learned about the concept of region and selected a region as needed.

You have activated SMS. For detailed directions, please see Getting Started.

You have obtained the `SecretID` and `SecretKey` on the API Key Management page in the CAM console.

`SecretID` is used to identify the API caller.

`SecretKey` is used to encrypt the string to sign that can be verified on the server. **You should keep it private and avoid disclosure.**

The endpoint of the SMS service is `sms.tencentcloudapi.com`.

FAQs

Proxy settings

If you use the SDK to call an API in a proxy environment, you need to set the system environment variable `https_proxy` (as shown in the sample code); otherwise, it may not be called normally, and a connection timeout exception will be thrown.

Sync and async calls

The new version of the SDK provides both async and sync APIs. The sync APIs uniformly have the `Sync` suffix after the async APIs as demonstrated in the code above.

Note:

In the sample, as it is a console application, you can call the async APIs synchronously, i.e., `ConfigureAwait(false).GetAwaiter().GetResult()` . When developing ASP applications or Windows

Forms applications, you cannot call the async APIs synchronously in the response method of UI controls; otherwise, the UI will stop responding.
The solution is to change the response method of the UI controls to async and pay attention to the sync context. In addition, as async call immediately returns control to the user, it is prone to cause the user to click multiple times or perform unexpected operations. Such problems should be avoided in the program. For the source code, please refer to the `WindowsFormsDemo` project.

Dependent version

Note：

The `FluentClient` on which the SDK depends is on v3.2, but this package is currently available on v4.0, which is incompatible with lower versions. Upgrading this package to v4.0 in NuGet will cause problems such as inability to call or call failure.

SDK for Go

Last updated：2024-06-27 15:48:00

SDK 3.0 is a companion tool for the TencentCloud API 3.0 platform. You can use all SMS APIs through the SDK. The new SDK version is unified and features the same SDK usage, API call methods, error codes, and returned packet formats for different programming languages.

Note:

API version required for connecting to Tencent Cloud International:

SMS API v2021-01-11 is required. For details, see the sample code.

SMS sending APIs:

One message can be sent to up to 200 numbers at a time.

Signature and body template APIs:

Individual users have no permission to use signature and body template APIs and can manage SMS signatures and SMS body templates only in the SMS console. To use the APIs, change "Individual Identity" to "Organizational Identity".

Prerequisites

You have learned about the concept of region and selected a region as needed.

You have activated SMS. For detailed directions, please see Getting Started.

You have obtained the `SecretID` and `SecretKey` on the API Key Management page in the CAM console.

`SecretID` is used to identify the API caller.

`SecretKey` is used to encrypt the string to sign that can be verified on the server. **You should keep it private and avoid disclosure.**

The endpoint of the SMS service is `sms.tencentcloudapi.com`.

Relevant Documents

For more information on the APIs and their parameters, please see API Documentation.

You can download the SDK source code from Github Repository.

Installing SDK

Installing via go get (recommended)

See Github repository: Installing via go get (recommended)

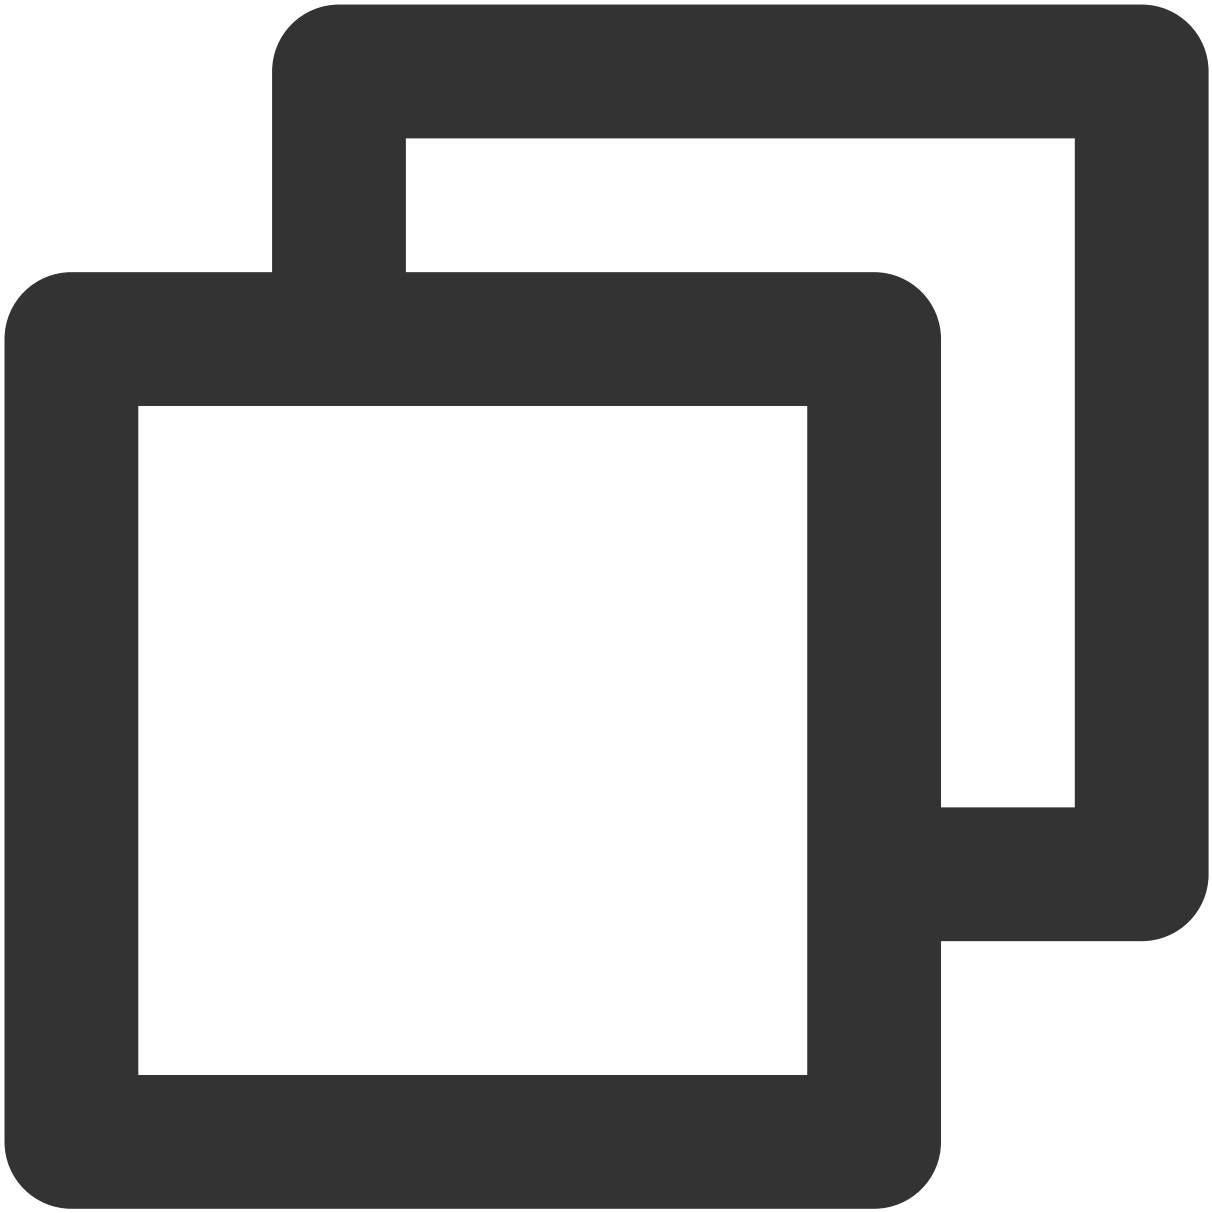
Installing via source code

See Github Repository: Installing via source code

Sample Code

Note:
All samples are for reference only and cannot be directly compiled and executed. You need to modify them based on your actual needs. You can also use API 3.0 Explorer to automatically generate the demo code as needed.
Each API has a corresponding request structure and a response structure. This document only lists the sample code of several common features as shown below:

Sending SMS message



```
package main

import (

        panic(err)
    }
    b, _ := json.Marshal(response.Response)
    // Print the returned JSON string
    fmt.Printf("%s", b)
}
```

FAQs

Proxy settings

If there is a proxy in your environment, you need to set the system environment variable `https_proxy`; otherwise, it may not be called normally, and a connection timeout exception will be thrown.

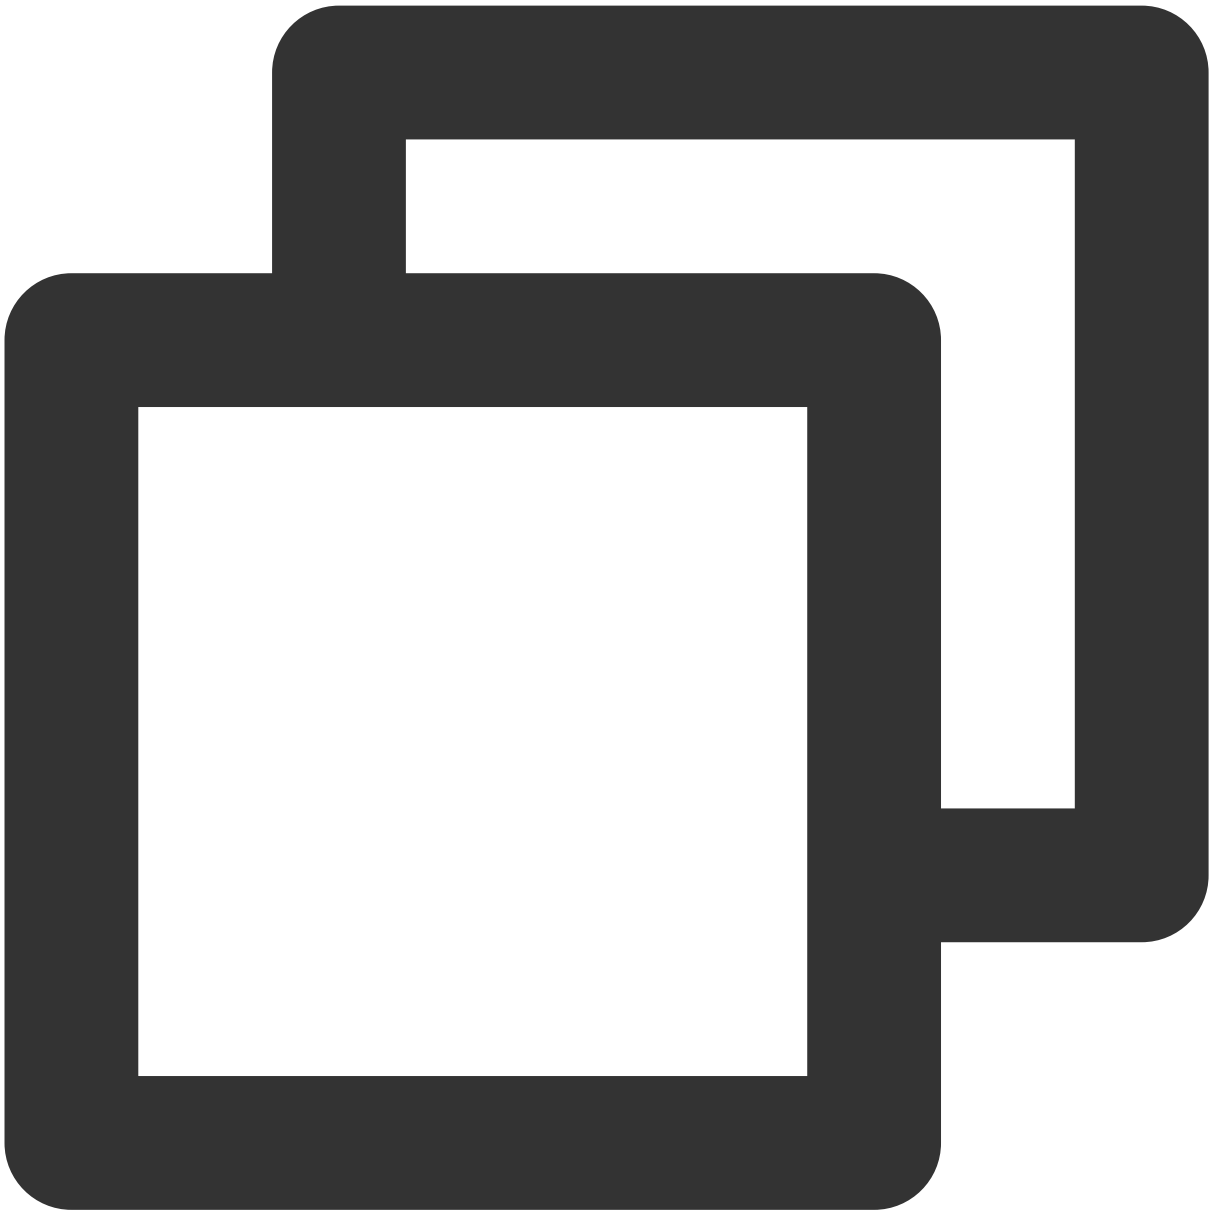
Enabling DNS cache

Currently, the SDK for Go always requests the DNS server without using the cache of nscd. You can export the environment variable `GODEBUG=netdns=cgo` or specify the `-tags 'netcgo'` parameter when compiling `go build` so as to get the nscd cache.

Ignoring server certificate verification

When the SDK is used to call a public cloud service, the server certificate must be verified to identify forged servers and ensure request security. However, in some extreme cases such as testing, you may need to ignore self-signed

server certificates. Below is one of the possible methods:



```
import "crypto/tls"
...
    client, _ := cvm.NewClient(credential, regions.Guangzhou, cpf)
    tr := &http.Transport{
        TLSClientConfig: &tls.Config{InsecureSkipVerify: true},
    }
    client.WithHttpTransport(tr)
...
```

Note:

Unless you know what you are doing and understand the risks involved, do not try to disable server certificate verification.

Failure of package import with import

For example, if the error `imported and not used: "os"` is reported, it means that the package `os` is not used in the code. Therefore, simply remove it.

SDK for C++

Last updated：2024-06-27 15:48:00

SDK 3.0 is a companion tool for the TencentCloud API 3.0 platform. You can use all SMS APIs through the SDK. The new SDK version is unified and features the same SDK usage, API call methods, error codes, and returned packet formats for different programming languages.

Note:

API version required for connecting to Tencent Cloud International::

SMS API v2021-01-11 is required. For details, see the sample code.

SMS delivery APIs: :

One message can be sent to up to 200 numbers at a time.

Signature and body template APIs: :

Individual users have no permission to use signature and body template APIs and can only manage SMS signatures and SMS body templates in the SMS console. To use the APIs, change "Individual Verification" to "Organization Verification". For details, see Identity Verification Change Guide.

Prerequisites

You have learned about the concept of Region and selected a region as needed.

You have activated the SMS service and created a signature and SMS template that have been approved. For details, see Getting Started.

You have got the `SecretId` and `SecretKey` on the Manage API Key page in the CAM console.

`SecretId` is used to identify the API caller.

`SecretKey` is a key used to encrypt the signature and help the server verify the signature. **You should keep it private and avoid disclosure**.

The endpoint of the SMS service is `sms.tencentcloudapi.com` .

Reference

For more information on the APIs and their parameters, see API Documentation.

You can download the SDK source code from Github Repository.

Installing SDK

Environmental Dependencies

See Github repository: Environmental Dependencies

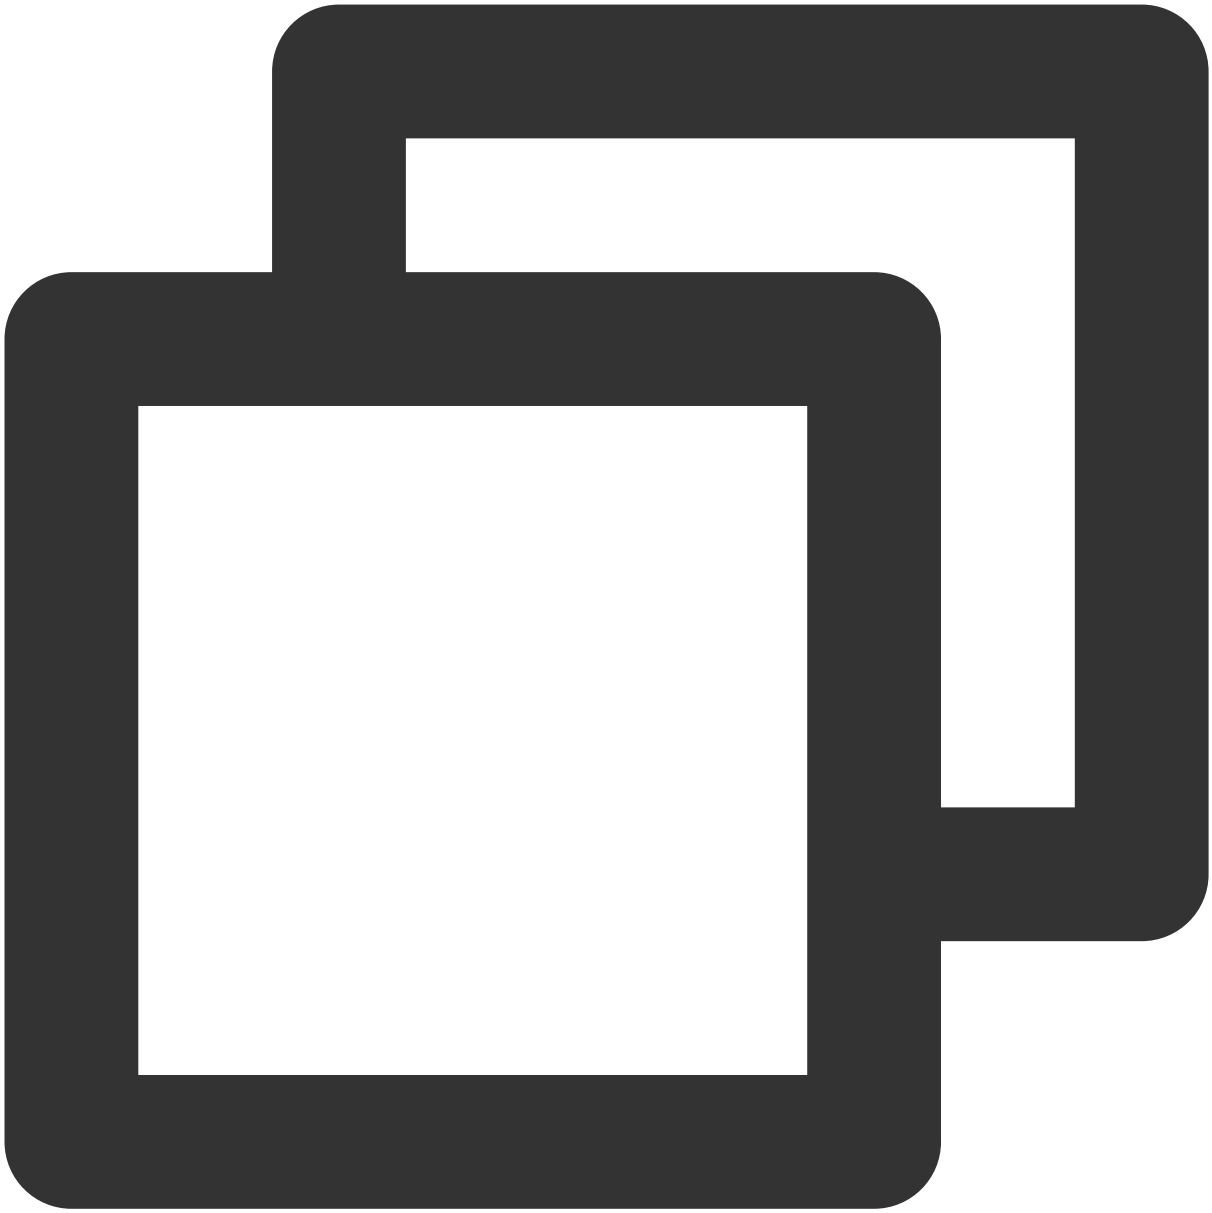
SDK build from source code

See Github repository: SDK build from source code

Sample Code

Note:
All samples are for reference only and cannot be directly compiled and executed. You need to modify them based on your actual needs. You can also use API 3.0 Explorer to automatically generate the demo code as needed.
Each API has its own request and response structures. This document only lists the sample code of several common features as shown below:

Sending SMS messages



```
#include <tencentcloud/core/TencentCloud.h>
