Notes

To better distinguish between sessions and improve data security, we recommend you create a separate database account for data migration.

As cutover requires pausing data writes into the source database, we recommend you cut over the business during off-peak hours.

Directions

1. Log in to the [DTS console](#) and proceed based on whether incremental migration is involved:

Incremental migration is involved: Go to step 2.

Incremental migration is not involved: Go to step 6.

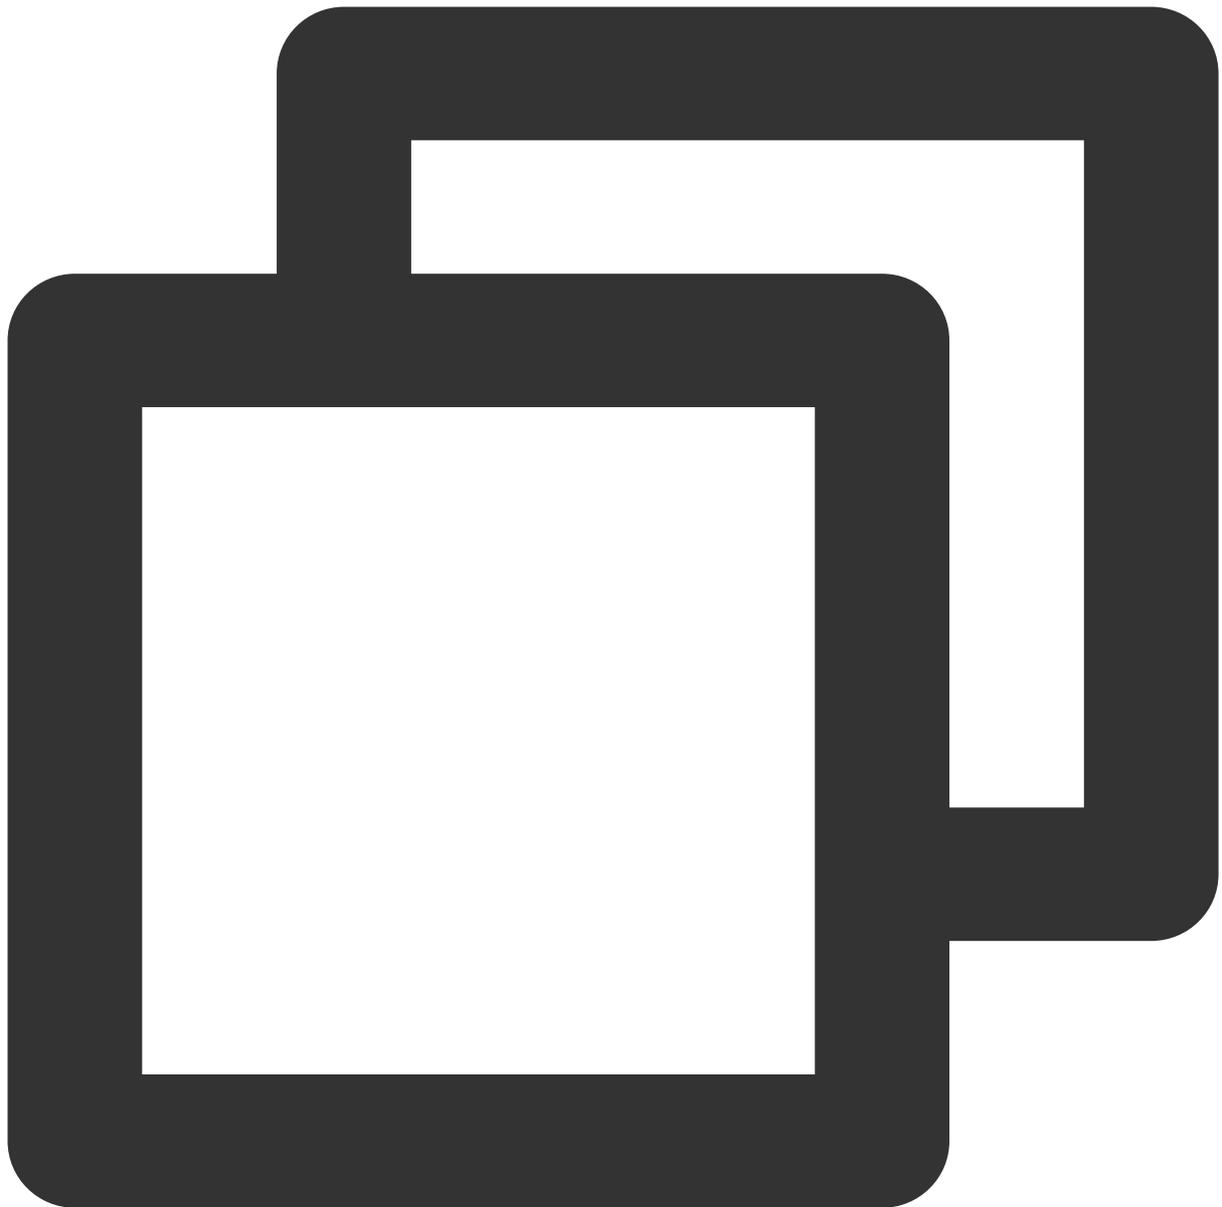

2. Wait until the **Migration Step** of the data migration task becomes **Syncing Incremental Data**, the source-target database data gap is 0 KB, and the source-target database time lag is 0s.

3. Pause the business in the source database and stop writing new data.

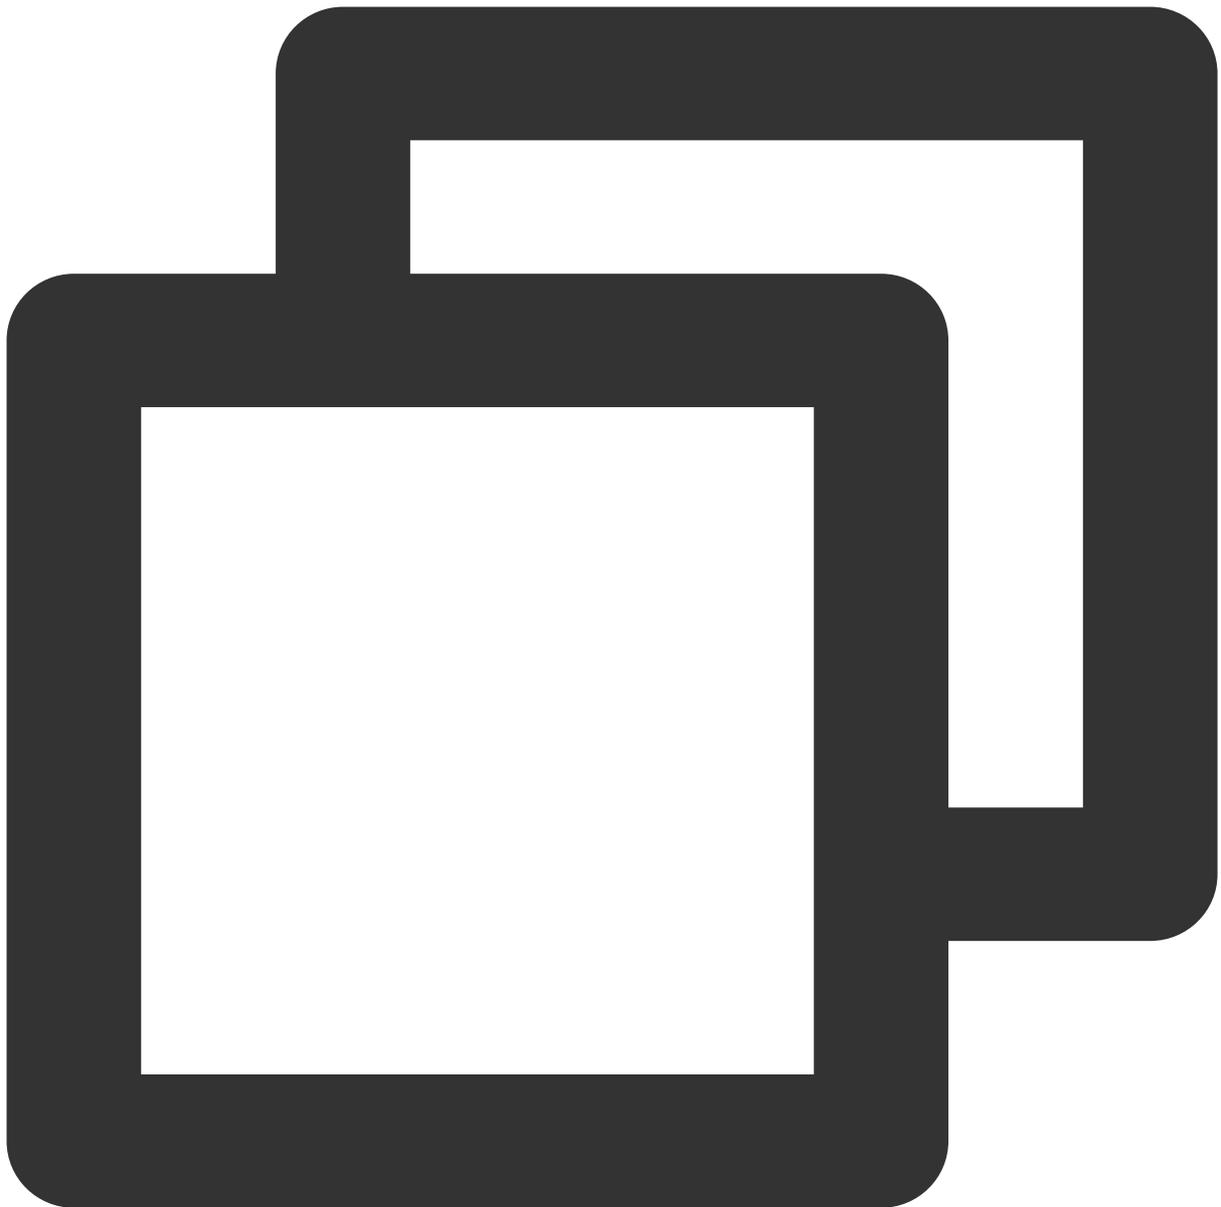

4. Choose the appropriate code below based on your source database type to view whether there is new session information. If the result shows that there is no new session being executed except the connection of the DTS migration instance in 1–5 minutes, the business can be deemed as completely stopped.

MySQL

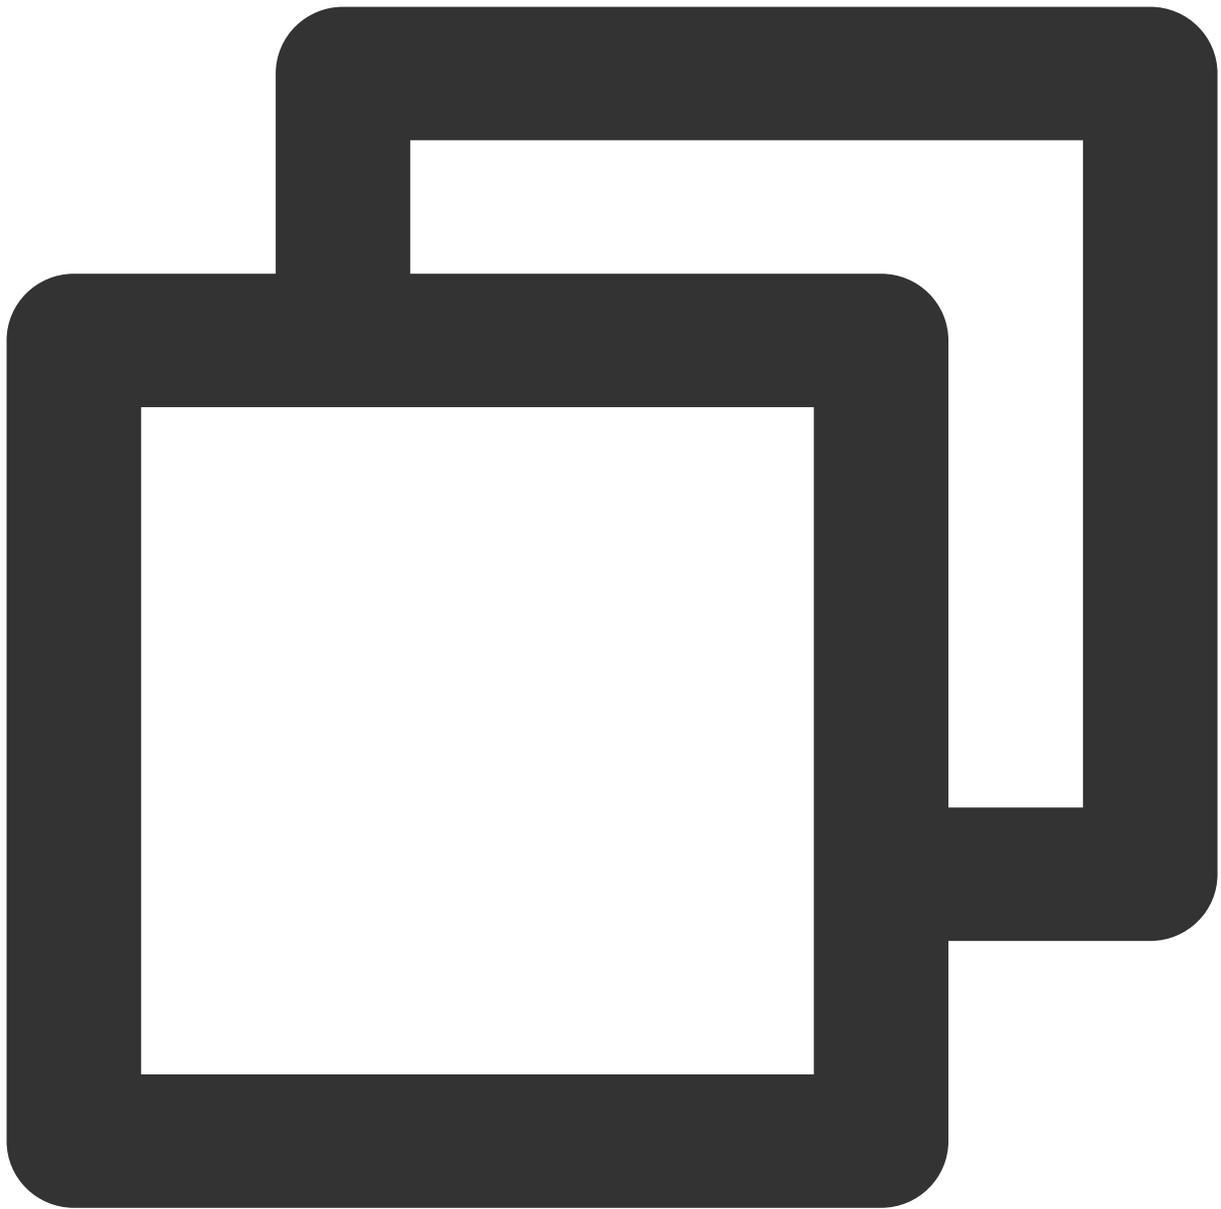

```
show processlist
```

SQL Server

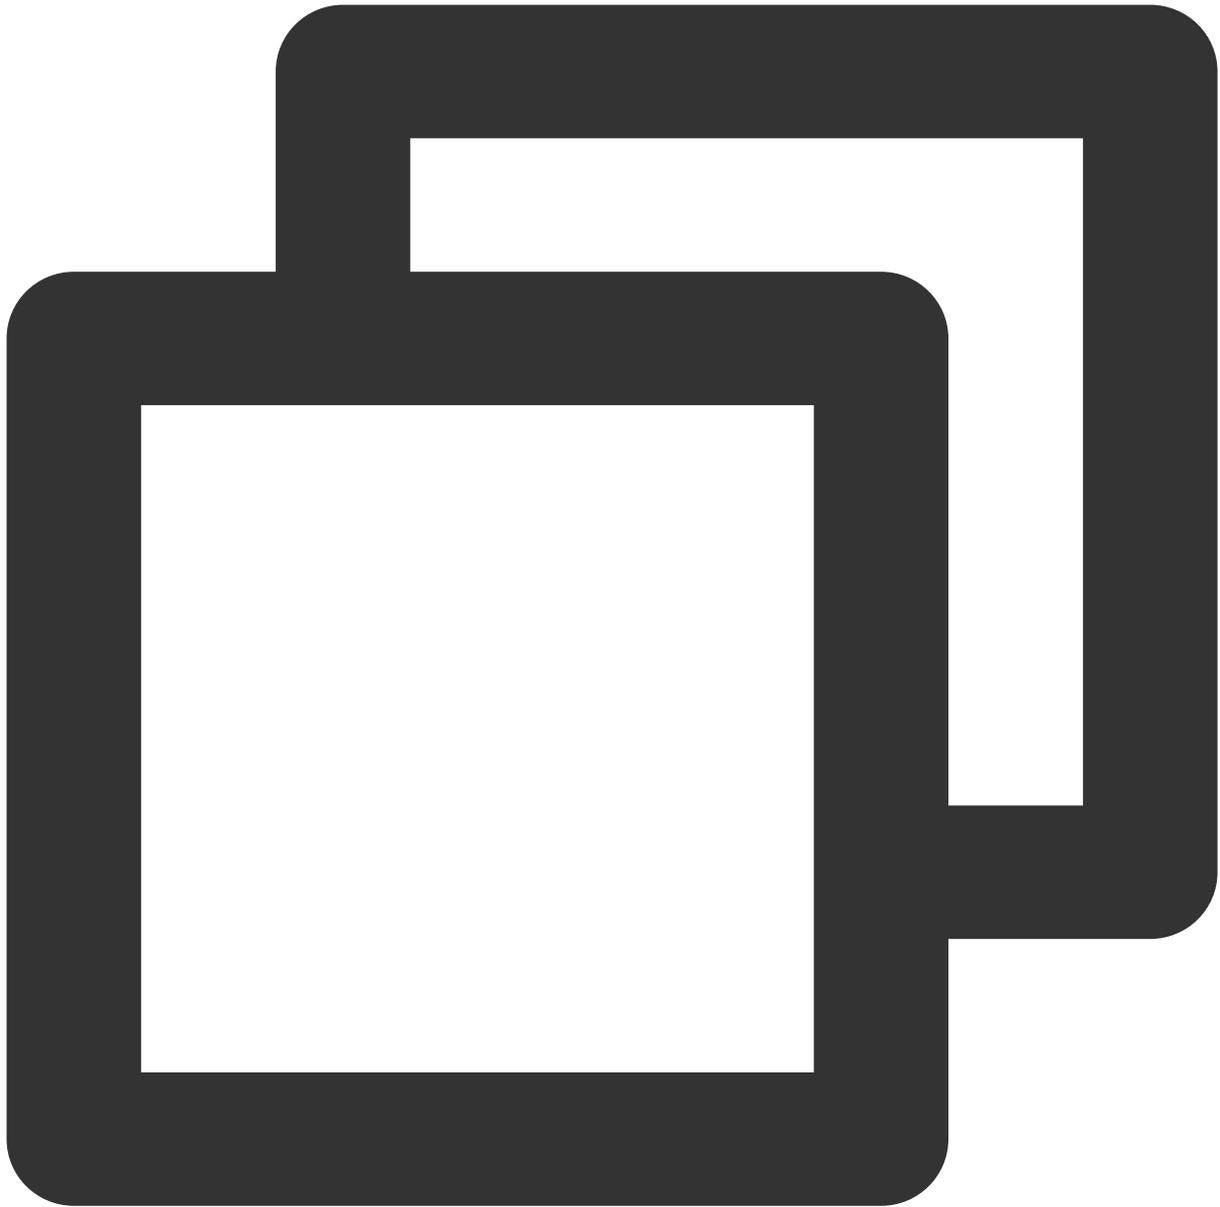

```
select * from sys.dm_exec_connections;
```

PostgreSQL

```
select * from pg_stat_activity;
```

MongoDB

```
use admin
db.runCommand({currentOp: 1, $all:[{"active" : true}]})
```

5. Stop the incremental migration task.

View the migration task again, wait for at least 1 minute after the source-target database data gap is 0 KB and the source-target database time lag is 0s, and click **Complete** to stop the incremental migration task.

The screenshot displays the Tencent Cloud Data Transfer Service console. On the left, there is a sidebar with a search bar and a 'NewDTS' button. The main area shows a job summary for 'binlog_sinker'. The job is in 'Immediate execution' mode with 'no job' running. The source and target are both 'MySQL' databases. The status is 'Prepared', and it started on '2021-12-01 19:38:46'. A red box highlights the 'Data lag between target and source databases: 0 MB' and 'Time lag between target and source databases: 0s'.

Job ID	Current step	Mode	Job Status	Source	Target	Database
(3 / 3) binlog_sinker	binlog_sinker	Immediate execution	no job	MySQL	MySQL	Database

Current step: binlog_sinker
Status: Prepared
Start: 2021-12-01 19:38:46
End: ...
Data lag between target and source databases: 0 MB
Time lag between target and source databases: 0s

6. After confirming that the data in the source and target databases is consistent, determine the cutover time, route the business system to the target database, and resume the business.
