History

Last updated : 2021-09-13 16:39:28

Release 3

Release time: 2021-09-13 16:24:25

Release updates:

Improvement to existing documentation.

Modified APIs:

- [CreateApp](#)
 - New output parameters:Data, RequestId
 - **Deleted output parameters:**BizId, AppName, ProjectId, SecretKey, CreateTime, RealtimeSpeechConf, VoiceMessageConf, VoiceFilterConf
- [DescribeAppStatistics](#)
 - New output parameters:Data, RequestId
 - **Deleted output parameters:**AppStatistics
- [ModifyAppStatus](#)
 - New output parameters:Data, RequestId
 - **Deleted output parameters:**BizId, Status

New data structures:

- [CreateAppResp](#)
- [DescribeAppStatisticsResp](#)
- [ModifyAppStatusResp](#)

Release 2

Release time: 2021-02-08 17:26:42

Release updates:

Improvement to existing documentation.

New APIs:

- [DescribeApplicationData](#)

New data structures:

- [ApplicationDataStatistics](#)
- [StatisticsItem](#)

Existing Release

Release time: 2020-07-30 19:58:02

Existing APIs/data structures are as follows:

Improvement to existing documentation.

Existing APIs:

- [CreateApp](#)
- [DescribeAppStatistics](#)
- [DescribeScanResultList](#)
- [ModifyAppStatus](#)
- [ScanVoice](#)

Existing data structures:

- [AppStatisticsItem](#)
- [DescribeScanResult](#)
- [RealTimeSpeechStatisticsItem](#)
- [RealtimeSpeechConf](#)
- [ScanDetail](#)
- [ScanPiece](#)
- [ScanVoiceResult](#)
- [Tag](#)
- [Task](#)
- [VoiceFilterConf](#)
- [VoiceFilterStatisticsItem](#)
- [VoiceMessageConf](#)
- [VoiceMessageStatisticsItem](#)

API Category

Last updated : 2021-09-13 16:25:49

Application APIs

API Name	Feature
CreateApp	Creates a GME application
ModifyAppStatus	Changes an application's status

Speech Analysis APIs

API Name	Feature
DescribeScanResultList	Queries speech detection result
ScanVoice	Submits speech detection task

Usage APIs

API Name	Feature
DescribeApplicationData	Obtains data details
DescribeAppStatistics	Gets application usage statistics

Making API Requests

Request Structure

Last updated : 2021-09-13 16:25:49

1. Service Address

The API supports access from either a nearby region (at `gme.tencentcloudapi.com`) or a specified region (at `gme.ap-guangzhou.tencentcloudapi.com` for Guangzhou, for example).

We recommend using the domain name to access the nearest server. When you call an API, the request is automatically resolved to a server in the region **nearest** to the location where the API is initiated. For example, when you initiate an API request in Guangzhou, this domain name is automatically resolved to a Guangzhou server, the result is the same as that of specifying the region in the domain like "`gme.ap-guangzhou.tencentcloudapi.com`".

Note: For latency-sensitive businesses, we recommend that you specify the region in the domain name.

Tencent Cloud currently supports the following regions:

Hosted region	Domain name
Local access region (recommended, only for non-financial availability zones)	<code>gme.tencentcloudapi.com</code>
South China (Guangzhou)	<code>gme.ap-guangzhou.tencentcloudapi.com</code>
East China (Shanghai)	<code>gme.ap-shanghai.tencentcloudapi.com</code>
North China (Beijing)	<code>gme.ap-beijing.tencentcloudapi.com</code>
Southwest China (Chengdu)	<code>gme.ap-chengdu.tencentcloudapi.com</code>
Southwest China (Chongqing)	<code>gme.ap-chongqing.tencentcloudapi.com</code>
Hong Kong, Macao, Taiwan (Hong Kong, China)	<code>gme.ap-hongkong.tencentcloudapi.com</code>

Southeast Asia (Singapore)	gme.ap-singapore.tencentcloudapi.com
Southeast Asia (Bangkok)	gme.ap-bangkok.tencentcloudapi.com
South Asia (Mumbai)	gme.ap-mumbai.tencentcloudapi.com
Northeast Asia (Seoul)	gme.ap-seoul.tencentcloudapi.com
Northeast Asia (Tokyo)	gme.ap-tokyo.tencentcloudapi.com
U.S. East Coast (Virginia)	gme.na-ashburn.tencentcloudapi.com
U.S. West Coast (Silicon Valley)	gme.na-siliconvalley.tencentcloudapi.com
North America (Toronto)	gme.na-toronto.tencentcloudapi.com
Europe (Frankfurt)	gme.eu-frankfurt.tencentcloudapi.com
Europe (Moscow)	gme.eu-moscow.tencentcloudapi.com

2. Communications Protocol

All the Tencent Cloud APIs communicate via HTTPS, providing highly secure communication tunnels.

3. Request Methods

Supported HTTP request methods:

- POST (recommended)
- GET

The Content-Type types supported by POST requests:

- application/json (recommended). The TC3-HMAC-SHA256 signature algorithm must be used.
- application/x-www-form-urlencoded. The HmacSHA1 or HmacSHA256 signature algorithm must be used.
- multipart/form-data (only supported by certain APIs). You must use TC3-HMAC-SHA256 to calculate the signature.

The size of a GET request packet is up to 32 KB. The size of a POST request is up to 1 MB when the HmacSHA1 or HmacSHA256 signature algorithm is used, and up to 10 MB when TC3-HMAC-SHA256 is used.

4. Character Encoding

Only UTF-8 encoding is used.

Common Params

Last updated : 2021-09-13 16:25:50

Common parameters are used for all APIs authenticating requestors. Common parameters must be included in all API requests, and they will not be described in individual API documents.

The exact contents of the common parameters will vary depending on the version of the signature method you use.

Common parameters for Signature Algorithm v3

When the TC3-HMAC-SHA256 algorithm is used, the common parameters should be uniformly placed in the HTTP request header, as shown below:

Parameter Name	Type	Required	Description
X-TC-Action	String	Yes	The name of the API for the desired operation. For the specific description of common parameter <code>Action</code> in the input parameter documentation. For example, the API for querying the CVM <code>DescribeInstances</code> .
X-TC-Region	String	Yes	Region parameter, which is used to identify the region to work with belongs. For values supported for an API, see the parameter <code>Region</code> in the input parameters in related API documentation. This parameter is not required for some APIs (which will be indicated in the documentation), and will not take effect even it is passed.
X-TC-Timestamp	Integer	Yes	The current UNIX timestamp that records the time when the request is sent. For example, 1529223702. Note: If the difference between the server time is greater than 5 minutes, a signature expires.
X-TC-Version	String	Yes	API version of the action. For the valid values, see the description of the parameter <code>Version</code> in the API documentation. For example, 2017-03-12.
Authorization	String	Yes	The HTTP authentication request header, for example: TC3-HMAC-SHA256 Credential=AKIDEXAMPLE/Date/service;SignedHeaders=content-type;host, Signature=fe5f80f77d5fa3beca038a248ff027d0445342fe2 Here: - TC3-HMAC-SHA256: Signature method, currently fixed as TC3-HMAC-SHA256 - Credential: Signature credential; AKIDEXAMPLE is the Secret Key ID

			<p>time, and this value must match the value of X-TC-Timesta in UTC time format; service is the name of the product/ser domain name prefix. For example, a domain name cvm.ter the CVM product and the value would be cvm;</p> <ul style="list-style-type: none"> - SignedHeaders: The headers that contains the authentic type and host are the required headers; - Signature: Signature digest.
X-TC-Token	String	No	The token used for a temporary certificate. It must be use can obtain the temporary key and token by calling a CAM / a long-term key.

Assuming you want to query the list of Cloud Virtual Machine instances in the Guangzhou region, the request structure in the form of request URL, request header and request body may be as follows:

Example of an HTTP GET request structure:

```
https://cvm.tencentcloudapi.com/?Limit=10&Offset=0
```

```
Authorization: TC3-HMAC-SHA256 Credential=AKIDz8krbsJ5yKBZQpn74WFkmLPx3EXAMPLE/2018-10-09/cvm/tc3_request, SignedHeaders=content-type;host, Signature=5da7a33f6993f0614b047e5df4582db9e9bf4672ba50567dba16c6ccf174c474
```

```
Content-Type: application/x-www-form-urlencoded
```

```
Host: cvm.tencentcloudapi.com
```

```
X-TC-Action: DescribeInstances
```

```
X-TC-Version: 2017-03-12
```

```
X-TC-Timestamp: 1539084154
```

```
X-TC-Region: ap-guangzhou
```

The following example shows you how to structure an HTTP POST (application/json) request:

```
https://cvm.tencentcloudapi.com/
```

```
Authorization: TC3-HMAC-SHA256 Credential=AKIDEXAMPLE/2018-05-30/cvm/tc3_request, SignedHeaders=content-type;host, Signature=582c400e06b5924a6f2b5d7d672d79c15b13162d9279b0855cfba6789a8edb4c
```

```
Content-Type: application/json
```

```
Host: cvm.tencentcloudapi.com
```

```
X-TC-Action: DescribeInstances
```

```
X-TC-Version: 2017-03-12
```

```
X-TC-Timestamp: 1527672334
```

```
X-TC-Region: ap-guangzhou
```

```
{"Offset":0,"Limit":10}
```

Example of an HTTP POST (multipart/form-data) request structure (only supported by specific APIs):

```
https://cvm.tencentcloudapi.com/
```

```
Authorization: TC3-HMAC-SHA256 Credential=AKIDEXAMPLE/2018-05-30/cvm/tc3_request, SignedHeaders=content-type;host, Signature=582c400e06b5924a6f2b5d7d672d79c15b13162d9279b0855cfba6789a8edb4c
```

```
Content-Type: multipart/form-data; boundary=58731222010402
```

```
Host: cvm.tencentcloudapi.com
```

```
X-TC-Action: DescribeInstances
```

```
X-TC-Version: 2017-03-12
```

```
X-TC-Timestamp: 1527672334
```

```
X-TC-Region: ap-guangzhou
```

```
--58731222010402
```

```
Content-Disposition: form-data; name="Offset"
```

```
0
```

```
--58731222010402
```

```
Content-Disposition: form-data; name="Limit"
```

```
10
```

```
--58731222010402--
```

Common parameters for Signature Algorithm v1

To adopt the HmacSHA1 and HmacSHA256 signature methods, common parameters must be put into the request string, as shown below:

Parameter Name	Type	Required	Description
Action	String	Yes	The name of the API for the desired operation. For the specific value, see the description of common parameter <code>Action</code> in the input parameters in related API documentation. For example, the API for querying the CVM instance list is <code>DescribeInstances</code> .
Region	String	Yes	Region parameter, which is used to identify the region to which the data you want to work with belongs. For values supported for an API, see the description of common parameter <code>Region</code> in the input parameters in related API documentation. Note: This parameter is not required for some APIs (which will be indicated in related API

			documentation), and will not take effect even if it is passed.
Timestamp	Integer	Yes	The current UNIX timestamp that records the time when the API request was initiated, for example, 1529223702. If the difference between the value and the current system time is too large, a signature expiration error may occur.
Nonce	Integer	Yes	A random positive integer used along with <code>Timestamp</code> to prevent replay attacks.
SecretId	String	Yes	The identifying SecretId obtained on the Cloud API Key page. A SecretId corresponds to a unique SecretKey which is used to generate the request signature (Signature).
Signature	String	Yes	Request signature used to verify the validity of this request. This is calculated based on the actual input parameters. For more information about how this is calculated, see the API authentication documentation.
Version	String	Yes	API version of the action. For the valid values, see the description of the common input parameter <code>Version</code> in the API documentation. For example, the version of CVM is 2017-03-12.
SignatureMethod	String	No	Signature method. Currently, only HmacSHA256 and HmacSHA1 are supported. The HmacSHA256 algorithm is used to verify the signature only when this parameter is specified as HmacSHA256. In other cases, the signature is verified with HmacSHA1.
Token	String	No	The token used for a temporary certificate. It must be used with a temporary key. You can obtain the temporary key and token by calling a CAM API. No token is required for a long-term key.

Assuming you want to query the list of Cloud Virtual Machine instances in the Guangzhou region, the request structure in the form of request URL, request header and request body may be as follows:

Example of an HTTP GET request structure:

```
https://cvm.tencentcloudapi.com/?Action=DescribeInstances&Version=2017-03-12&SignatureMethod=HmacSHA256&Timestamp=1527672334&Signature=37ac2f4fde00b0ac9bd9eadeb459b1bbee224158d66e7ae5fcadb70b2d181d02&Region=ap-guangzhou&Nonce=23823223&SecretId=AKIDEXAMPLE
```

```
Host: cvm.tencentcloudapi.com
```

```
Content-Type: application/x-www-form-urlencoded
```

Example of an HTTP POST request structure:

```
https://cvm.tencentcloudapi.com/
```

```
Host: cvm.tencentcloudapi.com
```

```
Content-Type: application/x-www-form-urlencoded
```

```
Action=DescribeInstances&Version=2017-03-12&SignatureMethod=HmacSHA256&Timestamp=1527672334&Signature=37ac2f4fde00b0ac9bd9eadeb459b1bbee224158d66e7ae5fcadb70b2d181d02&Region=ap-guangzhou&Nonce=23823223&SecretId=AKIDEXAMPLE
```

Signature v3

Last updated : 2020-12-23 15:13:16

TencentCloud API authenticates every single request, i.e., the request must be signed using the security credentials in the designated steps. Each request has to contain the signature information (Signature) in the common request parameters and be sent in the specified way and format.

Applying for Security Credentials

The security credential used in this document is a key, which includes a SecretId and a SecretKey. Each user can have up to two pairs of keys.

- SecretId: Used to identify the API caller, which is just like a username.
- SecretKey: Used to authenticate the API caller, which is just like a password.
- **You must keep your security credentials private and avoid disclosure; otherwise, your assets may be compromised. If they are disclosed, please disable them as soon as possible.**

You can apply for the security credentials through the following steps:

1. Log in to the [Tencent Cloud Console](#).
2. Go to the [TencentCloud API Key](#) console page.
3. On the [TencentCloud API Key](#) page, click **Create** to create a SecretId/SecretKey pair.

Using the Resources for Developers

TencentCloud API comes with SDKs for seven commonly used programming languages, including [Python](#), [Java](#), [PHP](#), [Go](#), [NodeJS](#) and [.NET](#). In addition, it provides [API Explorer](#) which enables online call, signature verification, and SDK code generation. If you have any troubles calculating a signature, consult these resources.

TC3-HMAC-SHA256 Signature Algorithm

Compatible with the previous HmacSHA1 and HmacSHA256 signature algorithms, the TC3-HMAC-SHA256 signature algorithm is more secure and supports larger requests and JSON format with better performance. We recommend using TC3-HMAC-SHA256 to calculate the signature.

TencentCloud API supports both GET and POST requests. For the GET method, only the Content-Type: application/x-www-form-urlencoded protocol format is supported. For the POST method, two protocol formats, Content-Type: application/json and Content-Type: multipart/form-data, are supported. The JSON format is supported by default for all business APIs, and the multipart format is supported only for specific business APIs. In this case, the API cannot be called in JSON format. See the specific business API documentation for more information. The POST method is recommended, as there is no difference in the results of both the methods, but the GET method only supports request packets up to 32 KB.

The following uses querying the list of CVM instances in the Guangzhou region as an example to describe the steps of signature splicing. We chose this API because:

1. CVM is activated by default, and this API is often used;
2. It is read-only and does not change the status of existing resources;
3. It covers many types of parameters, which allows it to be used to demonstrate how to use arrays containing data structures.

In the example, we try to choose common parameters and API parameters that are prone to mistakes. When you actually call an API, please use parameters based on the actual conditions. The parameters vary by API. Do not copy the parameters and values in this example.

Assuming that your SecretId and SecretKey are `AKIDz8krbsJ5yKBZQpn74WFkmLPx3*****` and `Gu5t9xGARNpq86cd98joQYCN3*****`, respectively, if you want to view the status of the instance in the Guangzhou region whose CVM instance name is "unnamed" and have only one data entry returned, then the request may be:

```
curl -X POST https://cvm.tencentcloudapi.com ¥
-H "Authorization: TC3-HMAC-SHA256 Credential=AKIDz8krbsJ5yKBZQpn74WFkmLPx3*****/2019-02-25/cv
m/tc3_request, SignedHeaders=content-type;host, Signature=c492e8e41437e97a620b728c301bb8d17e7dc0c
17eeabce80c20cd70fc3a78ff" ¥
-H "Content-Type: application/json; charset=utf-8" ¥
-H "Host: cvm.tencentcloudapi.com" ¥
-H "X-TC-Action: DescribeInstances" ¥
-H "X-TC-Timestamp: 1551113065" ¥
-H "X-TC-Version: 2017-03-12" ¥
-H "X-TC-Region: ap-guangzhou" ¥
-d '{"Limit": 1, "Filters": [{"Values": ["unnamed"], "Name": "instance-name"}]}'
```

The signature calculation process is explained in detail below.

1. Concatenating the CanonicalRequest String

Concatenate the canonical request string (CanonicalRequest) in the following pseudocode format:

```
CanonicalRequest =
HTTPRequestMethod + '␣' +
CanonicalURI + '␣' +
CanonicalQueryString + '␣' +
CanonicalHeaders + '␣' +
SignedHeaders + '␣' +
HashedRequestPayload
```

Field Name	Explanation
HTTPRequestMethod	HTTP request method (GET or POST). This example uses <code>POST</code> .
CanonicalURI	URI parameter. Slash ("/") is used for API 3.0.
CanonicalQueryString	<p>The query string in the URL of the originating HTTP request. This is always an empty string "" for POST requests, and is the string after the question mark (?) for GET requests. For example: Limit=10&Offset=0.</p> <p>Note: <code>CanonicalQueryString</code> must be URL-encoded, referencing RFC3986, the UTF8 character set. We recommend using the programming language library. All special characters must be encoded and capitalized.</p>
CanonicalHeaders	<p>Header information for signature calculation, including at least two headers of <code>host</code> and <code>content-type</code> . Custom headers can be added to participate in the signature process to improve the uniqueness and security of the request.</p> <p>Concatenation rules:</p> <ol style="list-style-type: none"> Both the key and value of the header should be converted to lowercase with the leading and trailing spaces removed, so they are concatenated in the format of key:value\n format; If there are multiple headers, they should be sorted in ASCII ascending order by the header keys (lowercase). <p>The calculation result in this example is <code>content-type:application/json; charset=utf-8␣host:cvm.tencentcloudapi.com␣</code> .</p> <p>Note: <code>content-type</code> must match the actually sent content. In some programming languages, a charset value would be added even if it is not specified. In this case, the request sent is different from the one signed, and the sever will return an error indicating that signature verification failed.</p>
SignedHeaders	Header information for signature calculation, indicating which headers of the request participate in the signature process (they must each individually correspond to the headers in

	<p>CanonicalHeaders). <code>Content-type</code> and <code>host</code> are required headers. Concatenation rules:</p> <ol style="list-style-type: none"> Both the key and value of the header should be converted to lowercase; If there are multiple headers, they should be sorted in ASCII ascending order by the header keys (lowercase) and separated by semicolons (;). <p>The value in this example is <code>content-type;host</code></p>
HashedRequestPayload	<p>Hash value of the request payload (i.e., the body, such as <code>{"Limit": 1, "Filters": [{"Values": ["unnamed"], "Name": "instance-name"}]}</code> in this example). The pseudocode for calculation is <code>Lowercase(HexEncode(Hash.SHA256(RequestPayload)))</code> by SHA256 hashing the payload of the HTTP request, performing hexadecimal encoding, and finally converting the encoded string to lowercase letters. For GET requests, <code>RequestPayload</code> is always an empty string. The calculation result in this example is <code>99d58dfbc6745f6747f36bfca17dee5e6881dc0428a0a36f96199342bc5b4907</code>.</p>

According to the rules above, the `CanonicalRequest` string obtained in the example is as follows:

POST

/

content-type:application/json; charset=utf-8

host:cvm.tencentcloudapi.com

content-type;host

99d58dfbc6745f6747f36bfca17dee5e6881dc0428a0a36f96199342bc5b4907

2. Concatenating the String to Be Signed

The string to sign is concatenated as follows:

```
StringToSign =
Algorithm + \n +
RequestTimestamp + \n +
CredentialScope + \n +
HashedCanonicalRequest
```

Field Name	Explanation
Algorithm	Signature algorithm, which is currently always <code>TC3-HMAC-SHA256</code> .

RequestTimestamp	Request timestamp, i.e., the value of the common parameter <code>X-TC-Timestamp</code> in the request header, which is the UNIX timestamp of the current time in seconds, such as <code>1551113065</code> in this example.
CredentialScope	Scope of the credential in the format of <code>Date/service/tc3_request</code> , including the date, requested service and termination string (<code>tc3_request</code>). Date is a date in UTC time, whose value should match the UTC date converted by the common parameter <code>X-TC-Timestamp</code> ; <code>service</code> is the product name, which should match the domain name of the product called. The calculation result in this example is <code>2019-02-25/cvm/tc3_request</code> .
HashedCanonicalRequest	Hash value of the CanonicalRequest string concatenated in the steps above. The pseudocode for calculation is <code>Lowercase(HexEncode(Hash.SHA256(CanonicalRequest)))</code> . The calculation result in this example is <code>2815843035062ffda5fd6f2a44ea8a34818b0dc46f024b8b3786976a3adda7a</code> .

Note:

1. Date has to be calculated from the timestamp "X-TC-Timestamp" and the time zone is UTC+0. If you add the system's local time zone information (such as UTC+8), calls can succeed both day and night but will definitely fail at 00:00. For example, if the timestamp is 1551113065 and the time in UTC+8 is 2019-02-26 00:44:25, the UTC+0 date in the calculated Date value should be 2019-02-25 instead of 2019-02-26.
2. Timestamp must be the same as your current system time, and your system time and standard time must be synced; if the difference between Timestamp and your current system time is larger than five minutes, the request will fail. If your system time is out of sync with the standard time for a while, the request will fail and return a signature expiration error.

According to the preceding rules, the string to be signed obtained in the example is as follows:

```
TC3-HMAC-SHA256
1551113065
2019-02-25/cvm/tc3_request
2815843035062ffda5fd6f2a44ea8a34818b0dc46f024b8b3786976a3adda7a
```

3. Calculating the Signature

1) Calculate the derived signature key with the following pseudocode:

```
SecretKey = "Gu5t9xGARNpq86cd98joQYCN3*****"
SecretDate = HMAC_SHA256("TC3" + SecretKey, Date)
SecretService = HMAC_SHA256(SecretDate, Service)
SecretSigning = HMAC_SHA256(SecretService, "tc3_request")
```

Field Name	Explanation
SecretKey	The original SecretKey, i.e., <code>Gu5t9xGARNpq86cd98joQYCN3*****</code> .
Date	The Date field information in <code>Credential</code> , such as <code>2019-02-25</code> in this example.
Service	Value in the Service field in <code>Credential</code> , such as <code>cvm</code> in this example.

2) Calculate the signature with the following pseudocode:

```
Signature = HexEncode(HMAC_SHA256(SecretSigning, StringToSign))
```

4. Concatenating the Authorization

The Authorization is concatenated as follows:

```
Authorization =
Algorithm + ' ' +
'Credential=' + SecretId + '/' + CredentialScope + ', ' +
'SignedHeaders=' + SignedHeaders + ', ' +
'Signature=' + Signature
```

Field Name	Explanation
Algorithm	Signature algorithm, which is always <code>TC3-HMAC-SHA256</code> .
SecretId	The SecretId in the key pair, i.e., <code>AKIDz8krbsJ5yKBZQpn74WfkmLPx3*****</code> .
CredentialScope	Credential scope (see above). The calculation result in this example is <code>2019-02-25/cvm/tc3_request</code> .
SignedHeaders	Header information for signature calculation (see above), such as <code>content-type;host</code> in this example.
Signature	Signature value. The calculation result in this example is <code>c492e8e41437e97a620b728c301bb8d17e7dc0c17eeabce80c20cd70fc3a78ff</code> .

According to the rules above, the value obtained in the example is:

```
TC3-HMAC-SHA256 Credential=AKIDz8krbsJ5yKBZQpn74WFkmLPx3*****/2019-02-25/cvm/tc3_request, SignedHeaders=content-type;host, Signature=c492e8e41437e97a620b728c301bb8d17e7dc0c17eeabce80c20cd70fc3a78ff
```

The following example shows a finished authorization header:

```
POST https://cvm.tencentcloudapi.com/

```

5. Signature Demo

When calling API 3.0, you are recommended to use the corresponding Tencent Cloud SDK 3.0 which encapsulates the signature process, enabling you to focus on only the specific APIs provided by the product when developing. See [SDK Center](#) for more information. Currently, the following programming languages are supported:

- [Python](#)
- [Java](#)
- [PHP](#)
- [Go](#)
- [NodeJS](#)
- [.NET](#)

To further explain the signing process, we will use a programming language to implement the process described above. The request domain name, API and parameter values in the sample are used here. This goal of this example is only to provide additional clarification for the signature process, please see the SDK for actual usage.

The final output URL might be: `https://cvm.tencentcloudapi.com/?`

```
Action=DescribeInstances&InstanceId.0=ins-09dx96dg&Limit=20&Nonce=11886&Offset=0&Region=ap-
```

guangzhou&SecretId=AKIDz8krbsJ5yKBZQpn74WFkmLPx3*****&Signature=EliP9YW3pW28FpsEdkXt%2F%2BWcGel%3D&Timestamp=1465185768&Version=2017-03-12.

Note: The key in the example is fictitious, and the timestamp is not the current time of the system, so if this URL is opened in the browser or called using commands such as curl, an authentication error will be returned: Signature expired. In order to get a URL that can work properly, you need to replace the SecretId and SecretKey in the example with your real credentials and use the current time of the system as the Timestamp.

Note: In the example below, even if you use the same programming language, the order of the parameters in the URL may be different for each execution. However, the order does not matter, as long as all the parameters are included in the URL and the signature is calculated correctly.

Note: The following code is only applicable to API 3.0. It cannot be directly used in other signature processes. Even with an older API, signature calculation errors may occur due to the differences in details. Please refer to the corresponding documentation.

Signature Failure

The following situational error codes for signature failure may occur. Please resolve the errors accordingly.

Error Code	Description
AuthFailure.SignatureExpire	Signature expired. Timestamp and server time cannot differ by more than five minutes.
AuthFailure.SecretIdNotFound	The key does not exist. Please go to the console to check whether it is disabled or you copied fewer or more characters.
AuthFailure.SignatureFailure	Signature error. It is possible that the signature was calculated incorrectly, the signature does not match the content actually sent, or the SecretKey is incorrect.
AuthFailure.TokenFailure	Temporary certificate token error.
AuthFailure.InvalidSecretId	Invalid key (not a TencentCloud API key type).

Signature

Last updated : 2021-08-03 14:49:02

Tencent Cloud API authenticates each access request, i.e. each request needs to include authentication information (Signature) in the common parameters to verify the identity of the requester.

The Signature is generated by the security credentials which include SecretId and SecretKey. If you don't have the security credentials yet, go to the [TencentCloud API Key](#) page to apply for them; otherwise, you cannot invoke the TencentCloud API.

1. Applying for Security Credentials

Before using the TencentCloud API for the first time, go to the [TencentCloud API Key](#) page to apply for security credentials.

Security credentials consist of SecretId and SecretKey:

- SecretId is used to identify the API requester.
- SecretKey is used to encrypt the signature string and verify it on the server.
- **You must keep your security credentials private and avoid disclosure.**

You can apply for the security credentials through the following steps:

1. Log in to the [Tencent Cloud Console](#).
2. Go to the [TencentCloud API Key](#) page.
3. On the [API Key Management](#) page, click **Create Key** to create a SecretId/SecretKey pair.

Note: Each account can have up to two pairs of SecretId/SecretKey.

2. Generating a Signature

With the SecretId and SecretKey, a signature can be generated. The following describes how to generate a signature:

Assume that the SecretId and SecretKey are:

- SecretId: AKIDz8krbsJ5yKBZQpn74WFkmLPx3*****
- SecretKey: Gu5t9xGARNpq86cd98joQYCN3*****

Note: This is just an example. For actual operations, please use your own SecretId and SecretKey.

Take the Cloud Virtual Machine's request to view the instance list (DescribeInstances) as an example. When you invoke this API, the request parameters may be as follows:

Parameter name	Description	Parameter value
Action	Method name	DescribeInstances
SecretId	Key ID	AKIDz8krbsJ5yKBZQpn74WFkmLPx3*****
Timestamp	Current timestamp	1465185768
Nonce	Random positive integer	11886
Region	Region where the instance is located	ap-guangzhou
InstanceIds.0	ID of the instance to query	ins-09dx96dg
Offset	Offset	0
Limit	Allowed maximum output	20
Version	API version number	2017-03-12

2.1. Sorting Parameters

First, sort all the request parameters in an ascending lexicographical order (ASCII code) by their names. Notes: (1) Parameters are sorted by their names instead of their values; (2) The parameters are sorted based on ASCII code, not in an alphabetical order or by values. For example, InstanceIds.2 should be arranged after InstanceIds.12. You can complete the sorting process using a sorting function in a programming language, such as the ksort function in PHP. The parameters in the example are sorted as follows:

```
{
  'Action' : 'DescribeInstances',
  'InstanceIds.0' : 'ins-09dx96dg',
  'Limit' : 20,
  'Nonce' : 11886,
  'Offset' : 0,
  'Region' : 'ap-guangzhou',
  'SecretId' : 'AKIDz8krbsJ5yKBZQpn74WFkmLPx3*****',
  'Timestamp' : 1465185768,
```

```
'Version': '2017-03-12',  
}
```

When developing in another programming language, you can sort these sample parameters and it will work as long as you obtain the same results.

2.2. Concatenating a Request String

This step generates a request string.

Format the request parameters sorted in the previous step into the form of "parameter name"="parameter value". For example, for the Action parameter, its parameter name is "Action" and its parameter value is "DescribeInstances", so it will become Action=DescribeInstances after formatted.

Note: The "parameter value" is the original value but not the value after URL encoding.

Then, concatenate the formatted parameters with "&". The resulting request string is as follows:

```
Action=DescribeInstances&InstanceIds.0=ins-09dx96dg&Limit=20&Nonce=11886&Offset=0&Region=ap-guang  
zhou&SecretId=AKIDz8krbsJ5yKBZQpn74WFkmLPx3*****&Timestamp=1465185768&Version=2017-03-12
```

2.3. Concatenating the Signature Original String

This step generates a signature original string.

The signature original string consists of the following parameters:

1. HTTP method: POST and GET modes are supported, and GET is used here for the request. Please note that the method name should be in all capital letters.
2. Request server: the domain name of the request to view the list of instances (DescribeInstances) is cvm.tencentcloudapi.com. The actual request domain name varies by the module to which the API belongs. For more information, see the instructions of the specific API.
3. Request path: The request path in the current version of TencentCloud API is fixed to /.
4. Request string: the request string generated in the previous step.

The concatenation rule of the signature original string is: Request method + request host + request path + ? + request string

The concatenation result of the example is:

```
GETcvm.tencentcloudapi.com/?Action=DescribeInstances&InstanceIds.0=ins-09dx96dg&Limit=20&Nonce=11  
886&Offset=0&Region=ap-guangzhou&SecretId=AKIDz8krbsJ5yKBZQpn74WFkmLPx3*****&Timestamp=14651857  
68&Version=2017-03-12
```

2.4. Generating a Signature String

This step generates a signature string.

First, use the HMAC-SHA1 algorithm to sign the **signature original string** obtained in the previous step, and then encode the generated signature using Base64 to obtain the final signature.

The specific code is as follows with the PHP language being used as an example:

```
$secretKey = 'Gu5t9xGARNpq86cd98joQYCN3*****';  
$srcStr = 'GETcvm.tencentcloudapi.com/?Action=DescribeInstances&InstanceIds.0=ins-09dx96dg&Limit=20&Nonce=11886&offset=0&Region=ap-guangzhou&SecretId=AKIDz8krbsJ5yKBZQpn74WFkmLPx3*****&Timestamp=1465185768&Version=2017-03-12';  
$signStr = base64_encode(hash_hmac('sha1', $srcStr, $secretKey, true));  
echo $signStr;
```

The final signature is:

```
zmmjn35mikh6pM3V7sUEuX4wyYM=
```

When developing in another programming language, you can sign and verify the original in the example above and it works as long as you get the same results.

3. Encoding a Signature String

The generated signature string cannot be directly used as a request parameter and must be URL encoded.

For example, if the signature string generated in the previous step is `zmmjn35mikh6pM3V7sUEuX4wyYM=`, the final signature string request parameter (Signature) is `zmmjn35mikh6pM3V7sUEuX4wyYM%3D`, which will be used to generate the final request URL.

Note: If your request method is GET, or the request method is POST and the Content-Type is application/x-www-form-urlencoded, then all the request parameter values need to be URL encoded (except the parameter key and the symbol of =) when sending the request. Non-ASCII characters need to be encoded with UTF-8 before URL encoding.

Note: The network libraries of some programming languages automatically URL encode all parameters, in which case there is no need to URL encode the signature string; otherwise, two rounds of URL encoding will cause the signature to fail.

Note: Other parameter values also need to be encoded using [RFC 3986](#). Use %XY in percent-encoding for special characters such as Chinese characters, where "X" and "Y" are hexadecimal characters (0-9 and uppercase A-F), and using lowercase will cause an error.

4. Signature Failure

The following situational error codes for signature failure may occur. Please resolve the errors accordingly.

Error code	Error description
AuthFailure.SignatureExpire	The signature is expired
AuthFailure.SecretIdNotFound	The key does not exist
AuthFailure.SignatureFailure	Signature error
AuthFailure.TokenFailure	Token error
AuthFailure.InvalidSecretId	Invalid key (not a TencentCloud API key type)

5. Signature Demo

When calling API 3.0, you are recommended to use the corresponding Tencent Cloud SDK 3.0 which encapsulates the signature process, enabling you to focus on only the specific APIs provided by the product when developing. See [SDK Center](#) for more information. Currently, the following programming languages are supported:

- [Python](#)
- [Java](#)
- [PHP](#)
- [Go](#)
- [NodeJS](#)
- [.NET](#)

To further explain the signing process, we will use a programming language to implement the process described above. The request domain name, API and parameter values in the sample are used here. This goal of this example is only to provide additional clarification for the signature process, please see the SDK for actual usage.

The final output URL might be: `https://cvm.tencentcloudapi.com/?`

`Action=DescribeInstances&InstanceIds.0=ins-`

`09dx96dg&Limit=20&Nonce=11886&Offset=0&Region=ap-`

`guangzhou&SecretId=AKIDz8krbsJ5yKBZQpn74WFkmLPx3*****&Signature=zmmjn35mikh6pM3V7sUEuX4wyYM%3D&Timestamp=1465185768&Version=2017-03-12` .

Note: The key in the example is fictitious, and the timestamp is not the current time of the system, so if this URL is opened in the browser or called using commands such as curl, an authentication error will be returned: Signature expired. In order to get a URL that can work properly, you need to replace the SecretId and SecretKey in the example with your real credentials and use the current time of the system as the Timestamp.

Note: In the example below, even if you use the same programming language, the order of the parameters in the URL may be different for each execution. However, the order does not matter, as long as all the parameters are included in the URL and the signature is calculated correctly.

Note: The following code is only applicable to API 3.0. It cannot be directly used in other signature processes. Even with an older API, signature calculation errors may occur due to the differences in details. Please refer to the corresponding documentation.

Java

```
import java.io.UnsupportedEncodingException;
import java.net.URLEncoder;
import java.util.Random;
import java.util.TreeMap;
import javax.crypto.Mac;
import javax.crypto.spec.SecretKeySpec;
import javax.xml.bind.DatatypeConverter;

public class TencentCloudAPIDemo {
    private final static String CHARSET = "UTF-8";
    public static String sign(String s, String key, String method) throws Exception {
        Mac mac = Mac.getInstance(method);
        SecretKeySpec secretKeySpec = new SecretKeySpec(key.getBytes(CHARSET), mac.getAlgorithm());
        mac.init(secretKeySpec);

Responses

Last updated : 2019-12-05 17:30:06

Response for Successful Requests

For example, when calling CAM API (version: 2017-03-12) to view the status of instances (DescribeInstancesStatus), if the request has succeeded, you may see the response as shown below:

```
{
  "Response": {
    "TotalCount": 0,
    "InstanceStatusSet": [],
    "RequestId": "b5b41468-520d-4192-b42f-595cc34b6c1c"
  }
}
```

- The API will return `Response`, which contains `RequestId`, as long as it processes the request. It does not matter if the request is successful or not.
- `RequestId` is the unique ID of an API request. Contact us with this ID when an exception occurs.
- Except for the fixed fields, all fields are action-specified. For the definitions of action-specified fields, see the corresponding API documentation. In this example, `TotalCount` and `InstanceStatusSet` are the fields specified by the API `DescribeInstancesStatus`. `0 TotalCount` means that the requester owns 0 CVM instance so the `InstanceStatusSet` is empty.

Response for Failed Requests

If the request has failed, you may see the response as shown below:

```
{
  "Response": {
    "Error": {
      "Code": "AuthFailure.SignatureFailure",
      "Message": "The provided credentials could not be validated. Please ensure your signature is correct."
    },
    "RequestId": "ed93f3cb-f35e-473f-b9f3-0d451b8b79c6"
  }
}
```

- The presence of the `Error` field indicates that the request has failed. A response for a failed request will include `Error`, `Code` and `Message` fields.
- `Code` is the code of the error that helps you identify the cause and solution. There are two types of error codes so you may find the code in either common error codes or API-specified error codes.
- `Message` explains the cause of the error. Note that the returned messages are subject to service updates. The information the messages provide may not be up-to-date and should not be the only source of reference.
- `RequestId` is the unique ID of an API request. Contact us with this ID when an exception occurs.

Common Error Codes

If there is an `Error` field in the response, it means that the API call failed. The `Code` field in `Error` indicates the error code. The following table lists the common error codes that all actions can return.

Error Code	Description
<code>AuthFailure.InvalidSecretId</code>	Invalid key (not a TencentCloud API key type).
<code>AuthFailure.MFAFailure</code>	MFA failed.
<code>AuthFailure.SecretIdNotFound</code>	The key does not exist.
<code>AuthFailure.SignatureExpire</code>	Signature expired.
<code>AuthFailure.SignatureFailure</code>	Signature error.
<code>AuthFailure.TokenFailure</code>	Token error.
<code>AuthFailure.UnauthorizedOperation</code>	The request does not have CAM authorization.
<code>DryRunOperation</code>	DryRun Operation. It means that the request would have succeeded, but the DryRun parameter was used.
<code>FailedOperation</code>	Operation failed.
<code>InternalError</code>	Internal error.
<code>InvalidAction</code>	The API does not exist.
<code>InvalidParameter</code>	Incorrect parameter.
<code>InvalidParameterValue</code>	Invalid parameter value.
<code>LimitExceeded</code>	Quota limit exceeded.

Error Code	Description
MissingParameter	A parameter is missing.
NoSuchVersion	The API version does not exist.
RequestLimitExceeded	The number of requests exceeds the frequency limit.
ResourceInUse	Resource is in use.
ResourceInsufficient	Insufficient resource.
ResourceNotFound	The resource does not exist.
ResourceUnavailable	Resource is unavailable.
UnauthorizedOperation	Unauthorized operation.
UnknownParameter	Unknown parameter.
UnsupportedOperation	Unsupported operation.
UnsupportedProtocol	HTTPS request method error. Only GET and POST requests are supported.
UnsupportedRegion	API does not support the requested region.

Application APIs

CreateApp

Last updated : 2021-09-13 16:25:51

1. API Description

Domain name for API request: gme.tencentcloudapi.com.

This API is used to create a GME application.

A maximum of 200 requests can be initiated per second for this API.

We recommend you to use API Explorer

[Try it](#)

API Explorer provides a range of capabilities, including online call, signature authentication, SDK code generation, and API quick search. It enables you to view the request, response, and auto-generated examples.

2. Input Parameters

The following request parameter list only provides API request parameters and some common parameters. For the complete common parameter list, see [Common Request Parameters](#).

Parameter Name	Required	Type	Description
Action	Yes	String	Common parameter. The value used for this API: CreateApp.
Version	Yes	String	Common parameter. The value used for this API: 2018-07-11.
Region	No	String	Common parameter. This parameter is not required for this API.
AppName	Yes	String	Application name
ProjectId	No	Integer	Tencent Cloud project ID. Default value: 0, which means the default project

EngineList.N	No	Array of String	List of engines to be supported. All values are selected by default.
RegionList.N	No	Array of String	Service region list. All values are selected by default.
RealtimeSpeechConf	No	RealtimeSpeechConf	Configuration information of voice chat
VoiceMessageConf	No	VoiceMessageConf	Configuration information of voice messaging and speech-to-text
VoiceFilterConf	No	VoiceFilterConf	Configuration information of phrase analysis
Tags.N	No	Array of Tag	List of tags to be added

3. Output Parameters

Parameter Name	Type	Description
Data	CreateAppResp	Returned data
RequestId	String	The unique request ID, which is returned for each request. RequestId is required for locating a problem.

4. Example

Example1 Creating a GME app by using custom configuration

This example shows you how to enable high-quality voice chat and phrase filtering, and disable voice messaging for a project.

Input Example

```
https://gme.tencentcloudapi.com/?Action=CreateApp
&AppName=simple_gme_application
&<common request parameters>
```

Output Example

```
{
  "Response": {
    "Data": {
      "AppName": "simple_gme_application",
      "CreateTime": 1568945078,
      "ProjectId": 10000,
      "BizId": 140000002,
      "SecretKey": "abcdefghijklmnop",
      "RealtimeSpeechConf": {
        "Status": "open",
        "Quality": "high"
      },
      "VoiceMessageConf": {
        "Status": "open",
        "Language": "cnen"
      },
      "VoiceFilterConf": {
        "Status": "open"
      }
    },
    "RequestId": "d61be8ca-f010-11e9-af81-fa163ee00eb7"
  }
}
```

5. Developer Resources

SDK

TencentCloud API 3.0 integrates SDKs that support various programming languages to make it easier for you to call APIs.

- [Tencent Cloud SDK 3.0 for Python](#)
- [Tencent Cloud SDK 3.0 for Java](#)
- [Tencent Cloud SDK 3.0 for PHP](#)
- [Tencent Cloud SDK 3.0 for Go](#)
- [Tencent Cloud SDK 3.0 for NodeJS](#)
- [Tencent Cloud SDK 3.0 for .NET](#)
- [Tencent Cloud SDK 3.0 for C++](#)

Command Line Interface

- [Tencent Cloud CLI 3.0](#)

6. Error Code

The following only lists the error codes related to the API business logic. For other error codes, see [Common Error Codes](#).

Error Code	Description
FailedOperation	Operation failed.
FailedOperation.UserFeeNegative	Operation not allowed as your account is in arrears.
InternalError	Internal error.
InvalidParameter	Incorrect parameter.
InvalidParameter.TagKey	Incorrect tag.
LimitExceeded.Application	The number of created applications has reached the upper limit.
UnauthorizedOperation	Unauthorized operation
UnauthorizedOperation.CreateAppDenied	Application creation is not authorized.
UnauthorizedOperation.UnRealNameAuth	Unverified user.
UnknownParameter	Unknown parameter.
UnsupportedOperation	Operation unsupported.

ModifyAppStatus

Last updated : 2021-09-13 16:25:51

1. API Description

Domain name for API request: gme.tencentcloudapi.com.

This API is used to change the status of an application's primary switch.

A maximum of 1000 requests can be initiated per second for this API.

We recommend you to use API Explorer

[Try it](#)

API Explorer provides a range of capabilities, including online call, signature authentication, SDK code generation, and API quick search. It enables you to view the request, response, and auto-generated examples.

2. Input Parameters

The following request parameter list only provides API request parameters and some common parameters. For the complete common parameter list, see [Common Request Parameters](#).

Parameter Name	Required	Type	Description
Action	Yes	String	Common parameter. The value used for this API: ModifyAppStatus.
Version	Yes	String	Common parameter. The value used for this API: 2018-07-11.
Region	No	String	Common parameter. This parameter is not required for this API.
BizId	Yes	Integer	Application ID, which is generated and returned by the backend after application creation.
Status	Yes	String	Application status. Valid values: open, close

3. Output Parameters

Parameter Name	Type	Description
Data	ModifyAppStatusResp	Returned data
RequestId	String	The unique request ID, which is returned for each request. RequestId is required for locating a problem.

4. Example

Example1 Turning off GME app 140000001

Input Example

```
https://gme.tencentcloudapi.com/?Action=ModifyAppStatus
&BizId=140000001
&Status=close
&<common request parameters>
```

Output Example

```
{
  "Response": {
    "Data": {
      "BizId": 140000001,
      "Status": "close"
    },
    "RequestId": "e2900289-f21e-43a8-a3bf-0b439cdbbbb8"
  }
}
```

ResourceNotFound	The resource does not exist.
ResourceNotFound.BizidIsNotFound	Incorrect application ID.
UnauthorizedOperation	Unauthorized operation
UnknownParameter	Unknown parameter.
UnsupportedOperation	Operation unsupported.

Speech Analysis APIs

ScanVoice

Last updated : 2021-09-01 15:56:20

1. API Description

Domain name for API request: gme.tencentcloudapi.com.

This API is used to submit a speech detection task. Up to 100 tasks can be added in the detection task list. Before using this API, please enable the speech analysis service in [Console > Service Configuration](#).

Feature trial description:

- You can try out the speech analysis service free of charge in [Console > Product Trial](#).

API feature description:

- This API can check audio streams or files for non-compliant content.
- The detection result can be obtained by setting the callback address (`Callback`) or calling the `DescribeScanResultList` API for polling.
- The scenario can be specified, such as abusive, pornographic, or politically sensitive information.
- Detection tasks can be submitted in batches. Up to 100 tasks can be added in the detection task list.

Audio file limit description:

- Audio file size limit: 100 MB
- Audio file duration limit: 30 minutes
- Supported audio file formats: .wav, .m4a, .amr, .mp3, .aac, .wma, .ogg

Audio stream limit description:

- Supported audio stream formats: .m3u8, .flv
- Supported audio stream transfer protocols: RTMP, HTTP, HTTPS
- Audio stream duration limit: 4 hours

- Audio/video stream separation and audio stream analysis are supported

Scenes and Label parameter description:

When submitting a speech detection task, you need to specify the `Scenes` parameter. **You are currently required to set the `Scenes` parameter to `["default"]`.** The detection result will contain the scenario specified at the time of request and detection result in the corresponding type.

Scenario	Description	Label
Speech detection	Speech detection type	normal: normal porn: pornographic politics: politically sensitive abuse: abusive ad: advertising terrorism: terrorism contraband: prohibited customized: custom keyword library. This feature is only available to allowlisted users. To try it out, please contact us .

Callback description:

- If the callback address parameter `Callback` (i.e., the URL of an HTTP(S) API) is specified in the request parameters, then the POST method should be supported and transferred data should be encoded with UTF-8.
- After the callback data is pushed, if the HTTP status code received is 200, the push is successful.
- HTTP header parameter description:

Name	Type	Required	Description
Signature	string	Yes	Signature. For more information, please see Signature generation description .

- Signature generation description:
 - The HMAC-SH1 algorithm should be used, and the result should be encoded with Base64;
 - The original signature string is the entire JSON content of POST and body (the length is subject to `Content-Length`);

- The signature key is the `SecretKey` of the application, which can be viewed in the console.
- Below is a sample callback (for more information on the fields, please see the structure: [DescribeScanResult](#)):

```
{
  "Code": 0,
  "DataId": "1400000000_test_data_id",
  "ScanFinishTime": 1566720906,
  "HitFlag": true,
  "Live": false,
  "Msg": "",
  "ScanPiece": [{
    "DumpUrl": "",
    "HitFlag": true,
    "MainType": "abuse",
    "RoomId": "123",
    "OpenId": "xxx",
    "Info": "",
    "Offset": 0,
    "Duration": 3400,
    "PieceStartTime": 1574684231,
    "ScanDetail": [{
      "EndTime": 1110,
      "KeyWord": "xxx",
      "Label": "abuse",
      "Rate": "90.00",
      "StartTime": 1110
    }, {
      "EndTime": 1380,
      "KeyWord": "xxx",
      "Label": "abuse",
      "Rate": "90.00",
      "StartTime": 930
    }, {
      "EndTime": 1560,
      "KeyWord": "xxx",
      "Label": "abuse",
      "Rate": "90.00",
      "StartTime": 930
    }, {
      "EndTime": 2820,
      "KeyWord": "xxx",
      "Label": "abuse",
      "Rate": "90.00",
      "StartTime": 2490
    }
  ]
}
```

```

}],
"ScanStartTime": 1566720905,
"Scenes": [
"default"
],
>Status": "Success",
"TaskId": "xxx",
"Url": "https://xxx/xxx.m4a"
}

```

A maximum of 1000 requests can be initiated per second for this API.

We recommend you to use API Explorer

[Try it](#)

API Explorer provides a range of capabilities, including online call, signature authentication, SDK code generation, and API quick search. It enables you to view the request, response, and auto-generated examples.

2. Input Parameters

The following request parameter list only provides API request parameters and some common parameters. For the complete common parameter list, see [Common Request Parameters](#).

Parameter Name	Required	Type	Description
Action	Yes	String	Common parameter. The value used for this API: ScanVoice.
Version	Yes	String	Common parameter. The value used for this API: 2018-07-11.
Region	No	String	Common parameter. This parameter is not required for this API.
BizId	Yes	Integer	Application ID, which is the <code>AppID</code> obtained when you create an application in Console > Service Management
Scenes.N	Yes	Array of String	Speech detection scenario. The value of this parameter is currently required to be <code>default</code> . Preset scenarios: abusive, pornographic, politically sensitive, advertising, terrorism, and prohibited scenarios. For specific values, please see the Label description above.

Parameter Name	Required	Type	Description
Live	Yes	Boolean	Whether it is a live stream. false: audio file detection, true: audio stream detection.
Tasks.N	Yes	Array of Task	Speech detection task list. Up to 100 tasks can be added in the list. The structure contains: <ul style="list-style-type: none"> DataId: unique data ID Url: URL-encoded data file URL, which is a pull address if the detected speech is a stream
Callback	No	String	Async callback address for detection result. For more information, please see the callback description above. (Note: if this field is empty, the detection result can only be obtained by calling the <code>DescribeScanResultList</code> API.)

3. Output Parameters

Parameter Name	Type	Description
Data	Array of ScanVoiceResult	Speech detection return. The <code>Data</code> field is a JSON array where each element contains: <ul style="list-style-type: none"> DataId: corresponding <code>DataId</code> in request. TaskID: detection task ID, which is used to poll the speech detection result.
RequestId	String	The unique request ID, which is returned for each request. RequestId is required for locating a problem.

4. Example

Example1 Submitting an audio file detection task - 2

This example shows you how to submit a speech detection task for an audio file where the callback address is empty and the `DescribeScanResultList` API needs to be called to poll the detection result.

Input Example

```
https://gme.tencentcloudapi.com/?Action=ScanVoice
&BizId=1400000000
```

```
&Scenes.0=default
&Live=false
&Callback=
&Tasks.0.DataId=1400000000_test_data_id
&Tasks.0.Url=http://xxx/audio_store/xxxx.mp3
&<Common request parameters>
```

Output Example

```
{
  "Response": {
    "Data": [
      {
        "DataId": "1400000000_test_data_id",
        "TaskId": "xxx-xxx-xxx"
      }
    ],
    "RequestId": "xxx-xxx-xxx"
  }
}
```

Example2 Submitting audio stream detection task

This example shows you how to submit a speech detection task for an audio stream where the callback address is empty and the `DescribeScanResultList` API needs to be called to poll the detection result.

Input Example

```
https://gme.tencentcloudapi.com/?Action=ScanVoice
&BizId=1400000000
&Scenes.0=default
&Live=true
&Callback=
&Tasks.0.DataId=1400000000_test_data_id
&Tasks.0.Url=https://xxxx
&<Common request parameters>
```

Output Example

```
{
  "Response": {
    "Data": [
      {
        "DataId": "1400000000_test_data_id",
```

```
"TaskId": "xxx-xxx-xxx"
}
],
"RequestId": "xxx-xxx-xxx"
}
}
```

Example3 Submitting audio file detection task

This example shows you how to submit a speech detection task for an audio file where the callback address (`Callback`) is set to get the detection result.

Input Example

```
https://gme.tencentcloudapi.com/?Action=ScanVoice
&BizId=1400000000
&Scenes.0=default
&Live=false
&Callback=https://0.0.0.0/user_callback
&Tasks.0.DataId=1400000000_test_data_id
&Tasks.0.Url=http://xxx/audio_store/xxx.mp3
&<Common request parameters>
```

Output Example

```
{
  "Response": {
    "Data": [
      {
        "DataId": "1400000000_test_data_id",
        "TaskId": "xxx-xxx-xxx"
      }
    ],
    "RequestId": "xxx-xxx-xxx"
  }
}
```

5. Developer Resources

SDK

TencentCloud API 3.0 integrates SDKs that support various programming languages to make it easier for you to call APIs.

- [Tencent Cloud SDK 3.0 for Python](#)
- [Tencent Cloud SDK 3.0 for Java](#)
- [Tencent Cloud SDK 3.0 for PHP](#)
- [Tencent Cloud SDK 3.0 for Go](#)
- [Tencent Cloud SDK 3.0 for NodeJS](#)
- [Tencent Cloud SDK 3.0 for .NET](#)
- [Tencent Cloud SDK 3.0 for C++](#)

Command Line Interface

- [Tencent Cloud CLI 3.0](#)

6. Error Code

The following only lists the error codes related to the API business logic. For other error codes, see [Common Error Codes](#).

Error Code	Description
FailedOperation	Operation failed.
InternalServerError	Internal error.
InvalidParameter	Incorrect parameter.
InvalidParameter.CallbackAddress	Incorrect callback URL.
MissingParameter.	Missing parameter.
ResourceNotFound	The resource does not exist.
ResourceUnavailable	The resource is unavailable
UnauthorizedOperation	Unauthorized operation
UnknownParameter	Unknown parameter.
UnsupportedOperation	Operation unsupported.

DescribeScanResultList

Last updated : 2021-05-10 14:44:03

1. API Description

Domain name for API request: gme.tencentcloudapi.com.

This API is used to query the speech detection result. Up to 100 tasks can be added in the task query list.

If the `Callback` field is not set when a speech detection task is submitted, this API will be needed to get the detection result.

A maximum of 1000 requests can be initiated per second for this API.

We recommend you to use API Explorer

[Try it](#)

API Explorer provides a range of capabilities, including online call, signature authentication, SDK code generation, and API quick search. It enables you to view the request, response, and auto-generated examples.

2. Input Parameters

The following request parameter list only provides API request parameters and some common parameters. For the complete common parameter list, see [Common Request Parameters](#).

Parameter Name	Required	Type	Description
Action	Yes	String	Common parameter. The value used for this API: DescribeScanResultList.
Version	Yes	String	Common parameter. The value used for this API: 2018-07-11.
Region	No	String	Common parameter. This parameter is not required for this API.
BizId	Yes	Integer	Application ID, which is the <code>AppID</code> obtained when you create an application in the console

TaskIdList.N	Yes	Array of String	List of IDs of the tasks to be queried. Up to 100 entries can be added in the ID list.
Limit	No	Integer	Number of task results to be returned. Default value: 10. Maximum value: 500. This parameter will be ignored for large file tasks where all results will be returned

3. Output Parameters

Parameter Name	Type	Description
Data	Array of DescribeScanResult	Result of the speech detection task to be queried Note: this field may return null, indicating that no valid values can be obtained.
RequestId	String	The unique request ID, which is returned for each request. RequestId is required for locating a problem.

4. Example

Example1 Querying speech detection result

Input Example

```
https://gme.tencentcloudapi.com/?Action=DescribeScanResultList
&BizId=1400000000
&TaskIdList.0=xxx
&Limit=20
&<Common request parameters>
```

Output Example

```
{
  "Data": [
    {
      "Code": 0,
      "DataId": "1400000000_test_data_id",
      "ScanFinishTime": 1566720906,
      "HitFlag": true,
    }
  ]
}
```

```
"Live": false,
"Msg": "",
"ScanPiece": [
  {
    "DumpUrl": "",
    "HitFlag": true,
    "MainType": "abuse",
    "Info": "",
    "Offset": 0,
    "Duration": 3400,
    "PieceStartTime": 1574684231,
    "ScanDetail": [
      {
        "EndTime": 1110,
        "KeyWord": "xxx",
        "Label": "abuse",

6. Error Code

The following only lists the error codes related to the API business logic. For other error codes, see [Common Error Codes](#).

Error Code	Description
FailedOperation	Operation failed.
InternalError	Internal error.
InvalidParameter	Incorrect parameter.
InvalidParameter.TagKey	Incorrect tag.
MissingParameter.	Missing parameter.

ResourceNotFound	The resource does not exist.
ResourceUnavailable	The resource is unavailable
UnauthorizedOperation	Unauthorized operation
UnknownParameter	Unknown parameter.
UnsupportedOperation	Operation unsupported.

Usage APIs

DescribeApplicationData

Last updated : 2021-05-10 14:44:01

1. API Description

Domain name for API request: gme.tencentcloudapi.com.

This API (DescribeApplicationData) is used to query usage data details within 90 days.

A maximum of 200 requests can be initiated per second for this API.

We recommend you to use API Explorer

[Try it](#)

API Explorer provides a range of capabilities, including online call, signature authentication, SDK code generation, and API quick search. It enables you to view the request, response, and auto-generated examples.

2. Input Parameters

The following request parameter list only provides API request parameters and some common parameters. For the complete common parameter list, see [Common Request Parameters](#).

Parameter Name	Required	Type	Description
Action	Yes	String	Common parameter. The value used for this API: DescribeApplicationData.
Version	Yes	String	Common parameter. The value used for this API: 2018-07-11.
Region	No	String	Common parameter. This parameter is not required for this API.
BizId	Yes	Integer	Application ID
StartDate	Yes	Date	Data start date in the format of yyyy-mm-dd, such as 2018-07-13
EndDate	Yes	Date	Data end date in the format of yyyy-mm-dd, such as

2018-07-13

3. Output Parameters

Parameter Name	Type	Description
Data	ApplicationDataStatistics	Application statistics
RequestId	String	The unique request ID, which is returned for each request. RequestId is required for locating a problem.

4. Example

Example1 Obtaining data details

Input Example

```
https://gme.tencentcloudapi.com/?Action=DescribeApplicationData
&BizId=2400000
&StartDate=2018-07-13
&EndDate=2018-07-14
&<Common request parameters>
```

Output Example

```
{

5. Developer Resources

SDK

TencentCloud API 3.0 integrates SDKs that support various programming languages to make it easier for you to call APIs.

- [Tencent Cloud SDK 3.0 for Python](#)
- [Tencent Cloud SDK 3.0 for Java](#)
- [Tencent Cloud SDK 3.0 for PHP](#)
- [Tencent Cloud SDK 3.0 for Go](#)
- [Tencent Cloud SDK 3.0 for NodeJS](#)
- [Tencent Cloud SDK 3.0 for .NET](#)
- [Tencent Cloud SDK 3.0 for C++](#)

Command Line Interface

- [Tencent Cloud CLI 3.0](#)

6. Error Code

The following only lists the error codes related to the API business logic. For other error codes, see [Common Error Codes](#).

Error Code	Description
InternalError	Internal error.
InvalidParameter	Incorrect parameter.
ResourceNotFound	The resource does not exist.
UnauthorizedOperation	Unauthorized operation
UnsupportedOperation	Operation unsupported.

DescribeAppStatistics

Last updated : 2021-09-13 16:25:50

1. API Description

Domain name for API request: gme.tencentcloudapi.com.

This API is used to get the usage statistics of a GME application, including those of voice chat, voice messaging and speech-to-text, phrase analysis, etc. The maximum query period is the past 30 days.

A maximum of 200 requests can be initiated per second for this API.

We recommend you to use API Explorer

[Try it](#)

API Explorer provides a range of capabilities, including online call, signature authentication, SDK code generation, and API quick search. It enables you to view the request, response, and auto-generated examples.

2. Input Parameters

The following request parameter list only provides API request parameters and some common parameters. For the complete common parameter list, see [Common Request Parameters](#).

Parameter Name	Required	Type	Description
Action	Yes	String	Common parameter. The value used for this API: DescribeAppStatistics.
Version	Yes	String	Common parameter. The value used for this API: 2018-07-11.
Region	No	String	Common parameter. This parameter is not required for this API.
BizId	Yes	Integer	GME application ID
StartDate	Yes	Date	Data start date (GMT+8) in the format of yyyy-mm-dd, such as 2018-07-13
EndDate	Yes	Date	Data end date (GMT+8) in the format of yyyy-mm-dd,

			such as 2018-07-13
Services.N	Yes	Array of String	List of services to be queried. Valid values: RealTimeSpeech, VoiceMessage, VoiceFilter

3. Output Parameters

Parameter Name	Type	Description
Data	DescribeAppStatisticsResp	App usage statistics
RequestId	String	The unique request ID, which is returned for each request. RequestId is required for locating a problem.

4. Example

Example1 Querying the usage statistics of voice chat and voice messaging and speech-to-text between August 1 and August 3, 2019

Input Example

```
https://gme.tencentcloudapi.com/?Action=DescribeAppStatistics
&BizId=140000001
&StartDate=2019-08-01
&EndDate=2019-08-03
&Services.0=RealTimeSpeech
&Services.1=VoiceMessage
&<common request parameters>
```

Output Example

```
{
  "Response": {
    "Data": {
      "AppStatistics": [
        {
          "Date": "2019-08-01",
          "RealtimeSpeechStatisticsItem": {
            "MainLandDau": 10000,

```

```
"MainLandPcu": 5000,
"MainLandDuration": 1000000,
"OverseaDau": 5000,
"OverseaPcu": 2000,
"OverseaDuration": 500000
},
"VoiceMessageStatisticsItem": {
"Dau": 68000
},
"VoiceFilterStatisticsItem": null
},
{
"Date": "2019-08-02",
"RealtimeSpeechStatisticsItem": {
"MainLandDau": 10000,
"MainLandPcu": 5000,
"MainLandDuration": 1000000,
"OverseaDau": 5000,
"OverseaPcu": 2000,
"OverseaDuration": 500000
},
"VoiceMessageStatisticsItem": {
"Dau": 68000
},
"VoiceFilterStatisticsItem": null
},
{
"Date": "2019-08-03",
"RealtimeSpeechStatisticsItem": {
"MainLandDau": 10000,
"MainLandPcu": 5000,
"MainLandDuration": 1000000,
"OverseaDau": 5000,
"OverseaPcu": 2000,
"OverseaDuration": 500000
},
"VoiceMessageStatisticsItem": {
"Dau": 68000
},
"VoiceFilterStatisticsItem": null
}
]
},
"RequestId": "9b993045-9fa1-47f4-9d25-79160f305be8"
}
}
```

6. Error Code

The following only lists the error codes related to the API business logic. For other error codes, see [Common Error Codes](#).

Error Code	Description
FailedOperation	Operation failed.
InternalError	Internal error.
InvalidParameter	Incorrect parameter.
InvalidParameter.DateInvalid	Invalid date.
InvalidParameter.TimeRangeError	Incorrect query time range.
ResourceNotFound	The resource does not exist.
ResourceNotFound.BizidIsNotFound	Incorrect application ID.
UnauthorizedOperation	Unauthorized operation
UnknownParameter	Unknown parameter.

UnsupportedOperation

Operation unsupported.

Data Types

Last updated : 2021-09-14 15:01:11

AppStatisticsItem

Application usage statistics

Used by actions: DescribeAppStatistics.

Name	Type	Description
RealtimeSpeechStatisticsItem	RealTimeSpeechStatisticsItem	Voice chat statistics Note: This field may return null, indicating that no valid values can be obtained.
VoiceMessageStatisticsItem	VoiceMessageStatisticsItem	Voice messaging statistics Note: This field may return null, indicating that no valid values can be obtained.
VoiceFilterStatisticsItem	VoiceFilterStatisticsItem	Phrase filtering statistics Note: This field may return null, indicating that no valid values can be obtained.
Date	Date	Statistical period

ApplicationDataStatistics

Application statistics

Used by actions: DescribeApplicationData.

Name	Type	Description
BizId	Integer	Application ID
DauDataNum	Integer	DAU data
DauDataMainland	Array of StatisticsItem	DAU in Chinese mainland

Name	Type	Description
DauDataOversea	Array of StatisticsItem	DAU outside Chinese mainland
DauDataSum	Array of StatisticsItem	Total DAU
DurationDataNum	Integer	Number of voice chat metrics
DurationDataMainland	Array of StatisticsItem	Duration of voice chat in Chinese mainland in minutes
DurationDataOversea	Array of StatisticsItem	Duration of voice chat outside Chinese mainland in minutes
DurationDataSum	Array of StatisticsItem	Total duration of voice chat in minutes
PcuDataNum	Integer	PCU data
PcuDataMainland	Array of StatisticsItem	PCU in Chinese mainland
PcuDataOversea	Array of StatisticsItem	PCU outside Chinese mainland
PcuDataSum	Array of StatisticsItem	Total PCU

CreateAppResp

Output parameters of `CreateApp`

Used by actions: `CreateApp`.

Name	Type	Description
BizId	Integer	App ID, automatically generated by the backend.
AppName	String	App name, the input of <code>AppName</code> .
ProjectId	Integer	Project ID, the input of <code>ProjectId</code> .
SecretKey	String	App key, used to initialize GME SDK.

Name	Type	Description
CreateTime	Integer	Timestamp, indicating when the service is created.
RealtimeSpeechConf	RealtimeSpeechConf	Configuration information of voice chat
VoiceMessageConf	VoiceMessageConf	Configuration information of voice messaging and speech-to-text
VoiceFilterConf	VoiceFilterConf	Configuration information of phrase analysis

DescribeAppStatisticsResp

Output parameters of app usage statistics

Used by actions: DescribeAppStatistics.

Name	Type	Description
AppStatistics	Array of AppStatisticsItem	App usage statistics

DescribeScanResult

Returned speech detection result

Used by actions: DescribeScanResultList.

Name	Type	Description
Code	Integer	Business return code
DataId	String	Unique data ID
ScanFinishTime	Integer	Detection completion timestamp
HitFlag	Boolean	Whether non-compliant information is detected
Live	Boolean	Whether it is a stream
Msg	String	Business return description Note: this field may return null, indicating that no valid values can be obtained.

Name	Type	Description
ScanPiece	Array of ScanPiece	Detection result, which will be returned if <code>Code</code> is 0 Note: this field may return null, indicating that no valid values can be obtained.
ScanStartTime	Integer	Detection task submission timestamp
Scenes	Array of String	Speech detection scenario, which corresponds to the <code>Scene</code> at the time of request
TaskId	String	Speech detection task ID, which is assigned by the backend
Url	String	File or stream address
Status	String	Detection task execution result task. Valid values: <ul style="list-style-type: none"> Start: task started Success: task ended successfully Error: exceptional

ModifyAppStatusResp

Output parameters of `ModifyAppStatus`

Used by actions: `ModifyAppStatus`.

Name	Type	Description
BizId	Integer	GME app ID
Status	String	App status. Valid values: <code>open</code> , <code>close</code>

RealTimeSpeechStatisticsItem

Voice chat usage statistics

Used by actions: `DescribeAppStatistics`.

Name	Type	Description
MainLandDau	Integer	DAU in Mainland China
MainLandPcu	Integer	PCU in Mainland China

Name	Type	Description
MainLandDuration	Integer	Total duration of use in Mainland China in minutes
OverseaDau	Integer	DAU outside Mainland China
OverseaPcu	Integer	PCU outside Mainland China
OverseaDuration	Integer	Total duration of use outside Mainland China in minutes

RealtimeSpeechConf

Configuration information of voice chat

Used by actions: CreateApp.

Name	Type	Required	Description
Status	String	No	Voice chat status. Valid values: open, close
Quality	String	No	Voice chat sound quality. Valid value: <code>high</code>

ScanDetail

Speech detection details

Used by actions: DescribeScanResultList.

Name	Type	Description
Label	String	Violation scenario. For more information, please see the definition of Label
Rate	String	Confidence score in scenario. Value range: [0.00,100.00]. The higher the score, the more likely the content is non-compliant
KeyWord	String	Non-compliant keyword
StartTime	Integer	Start time offset in milliseconds from 0 of keyword in audio
EndTime	Integer	End time offset in milliseconds from 0 of keyword in audio

ScanPiece

Speech detection result, which will be returned if `Code` is 0

Used by actions: DescribeScanResultList.

Name	Type	Description
DumpUrl	String	Audio retention address, which will be returned for stream detection. The audio will be retained for 30 minutes Note: this field may return null, indicating that no valid values can be obtained.
HitFlag	Boolean	Whether non-compliant information is detected
MainType	String	Main non-compliant content type Note: this field may return null, indicating that no valid values can be obtained.
ScanDetail	Array of ScanDetail	Speech detection details
RoomId	String	GME voice chat room ID, which is the <code>RoomId</code> passed through when the task was submitted Note: this field may return null, indicating that no valid values can be obtained.
OpenId	String	GME voice chat user ID, which is the <code>OpenId</code> passed through when the task was submitted Note: this field may return null, indicating that no valid values can be obtained.
Info	String	Remarks Note: this field may return null, indicating that no valid values can be obtained.
Offset	Integer	Offset time in milliseconds of segment in stream during stream detection Note: this field may return null, indicating that no valid values can be obtained.
Duration	Integer	Segment duration during stream detection Note: this field may return null, indicating that no valid values can be obtained.

Name	Type	Description
PieceStartTime	Integer	Segment detection start time Note: this field may return null, indicating that no valid values can be obtained.

ScanVoiceResult

Returned result of speech detection

Used by actions: ScanVoice.

Name	Type	Description
DataId	String	Data ID
TaskId	String	Task ID

StatisticsItem

Usage data

Used by actions: DescribeApplicationData.

Name	Type	Description
StatDate	Date	Date in the format of yyyy-mm-dd, such as 2018-07-13
Data	Integer	Statistics

Tag

Tag list

Used by actions: CreateApp.

Name	Type	Required	Description
TagKey	String	No	Tag key Note: This field may return null, indicating that no valid values can be obtained.

Name	Type	Required	Description
TagValue	String	No	Tag value Note: This field may return null, indicating that no valid values can be obtained.

Task

Speech detection task list

Used by actions: ScanVoice.

Name	Type	Required	Description
DataId	String	Yes	Unique data ID
Url	String	Yes	URL-encoded data file URL, which is a pull address if the detected speech is a stream
RoomId	String	No	GME voice chat room ID, which is entered during speech detection by GME voice chat
OpenId	String	No	GME voice chat user ID, which is entered during speech detection by GME voice chat

VoiceFilterConf

Configuration information of phrase filtering

Used by actions: CreateApp.

Name	Type	Required	Description
Status	String	No	Phrase filtering status. Valid values: open, close

VoiceFilterStatisticsItem

Phrase filtering usage statistics

Used by actions: DescribeAppStatistics.

Name	Type	Description
Duration	Integer	Total duration of phrase filtering

VoiceMessageConf

Configuration information of voice messaging and speech-to-text

Used by actions: CreateApp.

Name	Type	Required	Description
Status	String	No	Voice messaging and speech-to-text status. Valid values: open, close
Language	String	No	Language supported for voice messaging and speech-to-text. Valid values: all (all languages), cnen (Chinese and English). Default value: cnen

VoiceMessageStatisticsItem

Voice messaging usage statistics

Used by actions: DescribeAppStatistics.

Name	Type	Description
Dau	Integer	DAU of voice messaging and speech-to-text

Error Codes

Last updated : 2021-09-13 16:29:20

Feature Description

If there is an Error field in the response, it means that the API call failed. For example:

```
{
  "Response": {
    "Error": {
      "Code": "AuthFailure.SignatureFailure",
      "Message": "The provided credentials could not be validated. Please check your signature is correct."
    },
    "RequestId": "ed93f3cb-f35e-473f-b9f3-0d451b8b79c6"
  }
}
```

Code in Error indicates the error code, and Message indicates the specific information of the error.

Error Code List

Common Error Codes

Error Code	Description
ActionOffline	This API has been deprecated.
AuthFailure.InvalidAuthorization	Authorization in the request header is invalid.
AuthFailure.InvalidSecretId	Invalid key (not a TencentCloud API key type).
AuthFailure.MFAFailure	MFA failed.
AuthFailure.SecretIdNotFound	Key does not exist. Check if the key has been deleted or disabled in the console, and if not, check if the key is correctly entered. Note that whitespaces should not exist before or after the key.

Error Code	Description
AuthFailure.SignatureExpire	Signature expired. Timestamp and server time cannot differ by more than five minutes. Please ensure your current local time matches the standard time.
AuthFailure.SignatureFailure	Invalid signature. Signature calculation error. Please ensure you've followed the signature calculation process described in the Signature API documentation.
AuthFailure.TokenFailure	Token error.
AuthFailure.UnauthorizedOperation	The request is not authorized. For more information, see the CAM documentation.
DryRunOperation	DryRun Operation. It means that the request would have succeeded, but the DryRun parameter was used.
FailedOperation	Operation failed.
InternalError	Internal error.
InvalidAction	The API does not exist.
InvalidParameter	Incorrect parameter.
InvalidParameterValue	Invalid parameter value.
InvalidRequest	The multipart format of the request body is incorrect.
IpInBlacklist	Your IP is in uin IP blacklist.
IpNotInWhitelist	Your IP is not in uin IP whitelist.
LimitExceeded	Quota limit exceeded.
MissingParameter	A parameter is missing.
NoSuchProduct	The product does not exist.
NoSuchVersion	The API version does not exist.
RequestLimitExceeded	The number of requests exceeds the frequency limit.

Error Code	Description
RequestLimitExceeded.IPLimitExceeded	The number of ip requests exceeds the frequency limit.
RequestLimitExceeded.UinLimitExceeded	The number of uin requests exceeds the frequency limit.
RequestSizeLimitExceeded	The request size exceeds the upper limit.
ResourceInUse	Resource is in use.
ResourceInsufficient	Insufficient resource.
ResourceNotFound	The resource does not exist.
ResourceUnavailable	Resource is unavailable.
ResponseSizeLimitExceeded	The response size exceeds the upper limit.
ServiceUnavailable	Service is unavailable now.
UnauthorizedOperation	Unauthorized operation.
UnknownParameter	Unknown parameter.
UnsupportedOperation	Unsupported operation.
UnsupportedProtocol	HTTP(S) request protocol error; only GET and POST requests are supported.
UnsupportedRegion	API does not support the requested region.

Service Error Codes

Error Code	Description
FailedOperation.UserFeeNegative	Operation not allowed as your account is in arrears.
InvalidParameter.CallbackAddress	Incorrect callback URL.
InvalidParameter.DateInvalid	Invalid date.
InvalidParameter.TagKey	Incorrect tag.
InvalidParameter.TimeRangeError	Incorrect query time range.

Error Code	Description
LimitExceeded.Application	The number of created applications has reached the upper limit.
MissingParameter.	Missing parameter.
ResourceNotFound.BizidsNotFound	Incorrect application ID.
UnauthorizedOperation.CreateAppDenied	Application creation is not authorized.
UnauthorizedOperation.UnRealNameAuth	Unverified user.
