Introduction

最近更新时间：2023-03-24 17:18:28

Image Moderation System (IMS) can accurately recognize content in images that may be offensive, unsafe, or inappropriate. It allows you to configure an image blocklist to recognize custom types of content.

API Category

ImageModeration	Moderates image	100

Making API Requests

Request Structure

最近更新时间：2023-03-24 17:18:28

1. Service Address

The API supports access from either a nearby region (at `ims.tencentcloudapi.com`) or a specified region (at `ims.ap-guangzhou.tencentcloudapi.com` for Guangzhou, for example).

We recommend using the domain name to access the nearest server. When you call an API, the request is automatically resolved to a server in the region **nearest** to the location where the API is initiated. For example, when you initiate an API request in Guangzhou, this domain name is automatically resolved to a Guangzhou server, the result is the same as that of specifying the region in the domain like "`ims.ap-guangzhou.tencentcloudapi.com`".

Note: For latency-sensitive businesses, we recommend that you specify the region in the domain name.

Tencent Cloud currently supports the following regions:

Hosted region	Domain name
Local access region (recommended, only for non-financial availability zones)	<code>ims.tencentcloudapi.com</code>
South China (Guangzhou)	<code>ims.ap-guangzhou.tencentcloudapi.com</code>
East China (Shanghai)	<code>ims.ap-shanghai.tencentcloudapi.com</code>
North China (Beijing)	<code>ims.ap-beijing.tencentcloudapi.com</code>
Southwest China (Chengdu)	<code>ims.ap-chengdu.tencentcloudapi.com</code>
Southwest China (Chongqing)	<code>ims.ap-chongqing.tencentcloudapi.com</code>
Hong Kong, Macao, Taiwan (Hong Kong, China)	<code>ims.ap-hongkong.tencentcloudapi.com</code>
Southeast Asia (Singapore)	<code>ims.ap-singapore.tencentcloudapi.com</code>
Southeast Asia (Bangkok)	<code>ims.ap-bangkok.tencentcloudapi.com</code>

South Asia (Mumbai)	ims.ap-mumbai.tencentcloudapi.com
Northeast Asia (Seoul)	ims.ap-seoul.tencentcloudapi.com
Northeast Asia (Tokyo)	ims.ap-tokyo.tencentcloudapi.com
U.S. East Coast (Virginia)	ims.na-ashburn.tencentcloudapi.com
U.S. West Coast (Silicon Valley)	ims.na-siliconvalley.tencentcloudapi.com
North America (Toronto)	ims.na-toronto.tencentcloudapi.com
Europe (Frankfurt)	ims.eu-frankfurt.tencentcloudapi.com

2. Communications Protocol

All the Tencent Cloud APIs communicate via HTTPS, providing highly secure communication tunnels.

3. Request Methods

Supported HTTP request methods:

- POST (recommended)
- GET

The Content-Type types supported by POST requests:

- application/json (recommended). The TC3-HMAC-SHA256 signature algorithm must be used.
- application/x-www-form-urlencoded. The HmacSHA1 or HmacSHA256 signature algorithm must be used.
- multipart/form-data (only supported by certain APIs). You must use TC3-HMAC-SHA256 to calculate the signature.

The size of a GET request packet is up to 32 KB. The size of a POST request is up to 1 MB when the HmacSHA1 or HmacSHA256 signature algorithm is used, and up to 10 MB when TC3-HMAC-SHA256 is used.

4. Character Encoding

Only UTF-8 encoding is used.

Common Params

最近更新时间：2023-03-24 17:18:28

Common parameters are used for all APIs authenticating requestors. Common parameters must be included in all API requests, and they will not be described in individual API documents.

The exact contents of the common parameters will vary depending on the version of the signature method you use.

Common parameters for Signature Algorithm v3

When the TC3-HMAC-SHA256 algorithm is used, the common parameters should be uniformly placed in the HTTP request header, as shown below:

Parameter Name	Type	Required	Description
X-TC-Action	String	Yes	The name of the API for the desired operation. For the specific value, see description of common parameter <code>Action</code> in the input parameters in r documentation. For example, the API for querying the CVM instance list is <code>DescribeInstances</code> .
X-TC-Region	String	Yes	Region parameter, which is used to identify the region to which the data y work with belongs. For values supported for an API, see the description c parameter <code>Region</code> in the input parameters in related API documentati parameter is not required for some APIs (which will be indicated in relatec documentation), and will not take effect even it is passed.
X-TC-Timestamp	Integer	Yes	The current UNIX timestamp that records the time when the API request for example, 1529223702. Note: If the difference between the UNIX times server time is greater than 5 minutes, a signature expiration error may oc
X-TC-Version	String	Yes	API version of the action. For the valid values, see the description of the c parameter <code>Version</code> in the API documentation. For example, the versi 2017-03-12.
Authorization	String	Yes	The HTTP authentication request header, for example: TC3-HMAC-SHA256 Credential=AKIDEXAMPLE/Date/service/tc3_requ SignedHeaders=content-type;host, Signature=fe5f80f77d5fa3beca038a248ff027d0445342fe2855ddc96317 Here: - TC3-HMAC-SHA256: Signature method, currently fixed as this value; - Credential: Signature credential; AKIDEXAMPLE is the SecretId; Date is UTC time, and this value must match the value of X-TC-Timestamp (a co

			parameter) in UTC time format; service is the name of the product/service generally a domain name prefix. For example, a domain name cvm.tencent refers to the CVM product and the value would be cvm; - SignedHeaders: The headers that contains the authentication information type and host are the required headers; - Signature: Signature digest.
X-TC-Token	String	No	The token used for a temporary certificate. It must be used with a temporary key. You can obtain the temporary key and token by calling a CAM API. No token is required for a long-term key.

Assuming you want to query the list of Cloud Virtual Machine instances in the Guangzhou region, the request structure in the form of request URL, request header and request body may be as follows:

Example of an HTTP GET request structure:

```

https://cvm.tencentcloudapi.com/?Limit=10&Offset=0

Authorization: TC3-HMAC-SHA256 Credential=AKIDz8krbsJ5yKBZQpn74WFkmLPx3EXAMPLE/2018-10-09/cvm/tc3_request, SignedHeaders=content-type;host, Signature=5da7a33f6993f0614b047e5df4582db9e9bf4672ba50567dba16c6ccf174c474
Content-Type: application/x-www-form-urlencoded
Host: cvm.tencentcloudapi.com
X-TC-Action: DescribeInstances
X-TC-Version: 2017-03-12
X-TC-Timestamp: 1539084154
X-TC-Region: ap-guangzhou
    
```

The following example shows you how to structure an HTTP POST (application/json) request:

```

https://cvm.tencentcloudapi.com/

Authorization: TC3-HMAC-SHA256 Credential=AKIDEXAMPLE/2018-05-30/cvm/tc3_request, SignedHeaders=content-type;host, Signature=582c400e06b5924a6f2b5d7d672d79c15b13162d9279b0855cfba6789a8edb4c
Content-Type: application/json
Host: cvm.tencentcloudapi.com
X-TC-Action: DescribeInstances
X-TC-Version: 2017-03-12
X-TC-Timestamp: 1527672334
X-TC-Region: ap-guangzhou

{"Offset":0,"Limit":10}
    
```

Example of an HTTP POST (multipart/form-data) request structure (only supported by specific APIs):

```
https://cvm.tencentcloudapi.com/
```

```
Authorization: TC3-HMAC-SHA256 Credential=AKIDEXAMPLE/2018-05-30/cvm/tc3_request,
SignedHeaders=content-type;host, Signature=582c400e06b5924a6f2b5d7d672d79c15b1316
2d9279b0855cfba6789a8edb4c
```

```
Content-Type: multipart/form-data; boundary=58731222010402
```

```
Host: cvm.tencentcloudapi.com
```

```
X-TC-Action: DescribeInstances
```

```
X-TC-Version: 2017-03-12
```

```
X-TC-Timestamp: 1527672334
```

```
X-TC-Region: ap-guangzhou
```

```
--58731222010402
```

```
Content-Disposition: form-data; name="Offset"
```

```
0
```

```
--58731222010402
```

```
Content-Disposition: form-data; name="Limit"
```

```
10
```

```
--58731222010402--
```

Common parameters for Signature Algorithm v1

To adopt the HmacSHA1 and HmacSHA256 signature methods, common parameters must be put into the request string, as shown below:

Parameter Name	Type	Required	Description
Action	String	Yes	The name of the API for the desired operation. For the specific value, see the description of common parameter <code>Action</code> in the input parameters in related API documentation. For example, the API for querying the CVM instance list is <code>DescribeInstances</code> .
Region	String	Yes	Region parameter, which is used to identify the region to which the data you want to work with belongs. For values supported for an API, see the description of common parameter <code>Region</code> in the input parameters in related API documentation. Note: This parameter is not required for some APIs (which will be indicated in related API documentation), and will not take effect even if it is passed.

Timestamp	Integer	Yes	The current UNIX timestamp that records the time when the API request was initiated, for example, 1529223702. If the difference between the value and the current system time is too large, a signature expiration error may occur.
Nonce	Integer	Yes	A random positive integer used along with <code>Timestamp</code> to prevent replay attacks.
SecretId	String	Yes	The identifying SecretId obtained on the Cloud API Key page. A SecretId corresponds to a unique SecretKey which is used to generate the request signature (Signature).
Signature	String	Yes	Request signature used to verify the validity of this request. This is calculated based on the actual input parameters. For more information about how this is calculated, see the API authentication documentation.
Version	String	Yes	API version of the action. For the valid values, see the description of the common input parameter <code>Version</code> in the API documentation. For example, the version of CVM is 2017-03-12.
SignatureMethod	String	No	Signature method. Currently, only HmacSHA256 and HmacSHA1 are supported. The HmacSHA256 algorithm is used to verify the signature only when this parameter is specified as HmacSHA256. In other cases, the signature is verified with HmacSHA1.
Token	String	No	The token used for a temporary certificate. It must be used with a temporary key. You can obtain the temporary key and token by calling a CAM API. No token is required for a long-term key.

Assuming you want to query the list of Cloud Virtual Machine instances in the Guangzhou region, the request structure in the form of request URL, request header and request body may be as follows:

Example of an HTTP GET request structure:

```
https://cvm.tencentcloudapi.com/?Action=DescribeInstances&Version=2017-03-12&SignatureMethod=HmacSHA256&Timestamp=1527672334&Signature=37ac2f4fde00b0ac9bd9eadeb459b1bbec224158d66e7ae5fcadb70b2d181d02&Region=ap-guangzhou&Nonce=23823223&SecretId=AKIDEXAMPLE
```

```
Host: cvm.tencentcloudapi.com
Content-Type: application/x-www-form-urlencoded
```

Example of an HTTP POST request structure:

```
https://cvm.tencentcloudapi.com/
```

```
Host: cvm.tencentcloudapi.com
```

```
Content-Type: application/x-www-form-urlencoded
```

```
Action=DescribeInstances&Version=2017-03-12&SignatureMethod=HmacSHA256&Timestamp=1527672334&Signature=37ac2f4fde00b0ac9bd9eadeb459b1bbee224158d66e7ae5fcadb70b2d181d02&Region=ap-guangzhou&Nonce=23823223&SecretId=AKIDEXAMPLE
```

Region List

The supported Region field values for all APIs in this product are listed as below. For any API that does not support any of the following regions, this field will be described additionally in the relevant API document.

Region	Value
North China (Beijing)	ap-beijing
South China (Guangzhou)	ap-guangzhou
South Asia Pacific (Mumbai)	ap-mumbai
East China (Shanghai)	ap-shanghai
Southeast Asia Pacific (Singapore)	ap-singapore
Europe (Frankfurt)	eu-frankfurt
Eastern U.S. (Virginia)	na-ashburn
Western U.S. (Silicon Valley)	na-siliconvalley

Signature v3

最近更新时间：2022-03-28 10:56:52

TencentCloud API authenticates every single request, i.e., the request must be signed using the security credentials in the designated steps. Each request has to contain the signature information (Signature) in the common request parameters and be sent in the specified way and format.

Applying for Security Credentials

The security credential used in this document is a key, which includes a SecretId and a SecretKey. Each user can have up to two pairs of keys.

- SecretId: Used to identify the API caller, which is just like a username.
- SecretKey: Used to authenticate the API caller, which is just like a password.
- **You must keep your security credentials private and avoid disclosure; otherwise, your assets may be compromised. If they are disclosed, please disable them as soon as possible.**

You can apply for the security credentials through the following steps:

1. Log in to the [Tencent Cloud Console](#).
2. Go to the [TencentCloud API Key](#) console page.
3. On the [TencentCloud API Key](#) page, click **Create** to create a SecretId/SecretKey pair.

Using the Resources for Developers

TencentCloud API comes with SDKs for seven commonly used programming languages, including [Python](#), [Java](#), [PHP](#), [Go](#), [NodeJS](#) and [.NET](#). In addition, it provides [API Explorer](#) which enables online call, signature verification, and SDK code generation. If you have any troubles calculating a signature, consult these resources.

TC3-HMAC-SHA256 Signature Algorithm

Compatible with the previous HmacSHA1 and HmacSHA256 signature algorithms, the TC3-HMAC-SHA256 signature algorithm is more secure and supports larger requests and JSON format with better performance. We recommend using TC3-HMAC-SHA256 to calculate the signature.

TencentCloud API supports both GET and POST requests. For the GET method, only the Content-Type: application/x-www-form-urlencoded protocol format is supported. For the POST method, two protocol formats,

Content-Type: application/json and Content-Type: multipart/form-data, are supported. The JSON format is supported by default for all business APIs, and the multipart format is supported only for specific business APIs. In this case, the API cannot be called in JSON format. See the specific business API documentation for more information. The POST method is recommended, as there is no difference in the results of both the methods, but the GET method only supports request packets up to 32 KB.

The following uses querying the list of CVM instances in the Guangzhou region as an example to describe the steps of signature splicing. We chose this API because:

1. CVM is activated by default, and this API is often used;
2. It is read-only and does not change the status of existing resources;
3. It covers many types of parameters, which allows it to be used to demonstrate how to use arrays containing data structures.

In the example, we try to choose common parameters and API parameters that are prone to mistakes. When you actually call an API, please use parameters based on the actual conditions. The parameters vary by API. Do not copy the parameters and values in this example.

Assuming that your SecretId and SecretKey are `AKIDz8krbsJ5yKBZQpn74WFkmLPx3*****` and `Gu5t9xGARNpq86cd98joQYCN3*****`, respectively, if you want to view the status of the instance in the Guangzhou region whose CVM instance name is "unnamed" and have only one data entry returned, then the request may be:

```
curl -X POST https://cvm.tencentcloudapi.com \
-H "Authorization: TC3-HMAC-SHA256 Credential=AKIDz8krbsJ5yKBZQpn74WFkmLPx3*****
*/2019-02-25/cvm/tc3_request, SignedHeaders=content-type;host, Signature=c492e8e4
1437e97a620b728c301bb8d17e7dc0c17eeabce80c20cd70fc3a78ff" \
-H "Content-Type: application/json; charset=utf-8" \
-H "Host: cvm.tencentcloudapi.com" \
-H "X-TC-Action: DescribeInstances" \
-H "X-TC-Timestamp: 1551113065" \
-H "X-TC-Version: 2017-03-12" \
-H "X-TC-Region: ap-guangzhou" \
-d '{"Limit": 1, "Filters": [{"Values": ["unnamed"], "Name": "instance-name"}]}'
```

The signature calculation process is explained in detail below.

1. Concatenating the CanonicalRequest String

Concatenate the canonical request string (CanonicalRequest) in the following pseudocode format:

```
CanonicalRequest =
HTTPRequestMethod + '\n' +
CanonicalURI + '\n' +
```

```
CanonicalQueryString + '\n' +
CanonicalHeaders + '\n' +
SignedHeaders + '\n' +
HashedRequestPayload
```

Field Name	Explanation
HTTPRequestMethod	HTTP request method (GET or POST). This example uses <code>POST</code> .
CanonicalURI	URI parameter. Slash ("/") is used for API 3.0.
CanonicalQueryString	<p>The query string in the URL of the originating HTTP request. This is always an empty string for POST requests, and is the string after the question mark (?) for GET requests. For example: <code>Limit=10&Offset=0</code>.</p> <p>Note: <code>CanonicalQueryString</code> must be URL-encoded, referencing RFC3986, the UTF8 character set. We recommend using the programming language library. All special characters must be encoded and capitalized.</p>
CanonicalHeaders	<p>Header information for signature calculation, including at least two headers of <code>host</code> and <code>content-type</code>. Custom headers can be added to participate in the signature process to improve the uniqueness and security of the request.</p> <p>Concatenation rules:</p> <ol style="list-style-type: none"> Both the key and value of the header should be converted to lowercase with the leading and trailing spaces removed, so they are concatenated in the format of <code>key:value\n</code> format; If there are multiple headers, they should be sorted in ASCII ascending order by the header keys (lowercase). <p>The calculation result in this example is <code>content-type:application/json; charset=utf-8\nhost:cvm.tencentcloudapi.com\n</code>.</p> <p>Note: <code>content-type</code> must match the actually sent content. In some programming languages, a charset value would be added even if it is not specified. In this case, the request sent is different from the one signed, and the server will return an error indicating signature verification failed.</p>
SignedHeaders	<p>Header information for signature calculation, indicating which headers of the request participate in the signature process (they must each individually correspond to the headers in CanonicalHeaders). <code>Content-type</code> and <code>host</code> are required headers.</p> <p>Concatenation rules:</p> <ol style="list-style-type: none"> Both the key and value of the header should be converted to lowercase; If there are multiple headers, they should be sorted in ASCII ascending order by the header keys (lowercase) and separated by semicolons (;). <p>The value in this example is <code>content-type;host</code></p>
HashedRequestPayload	Hash value of the request payload (i.e., the body, such as <code>{"Limit": 1, "Filter</code>

```
[{"Values": ["unnamed"], "Name": "instance-name"}]} in this example
```

The pseudocode for calculation is
 Lowercase(HexEncode(Hash.SHA256(RequestPayload))) by SHA256 hashing the pay
 of the HTTP request, performing hexadecimal encoding, and finally converting the encc
 string to lowercase letters. For GET requests, `RequestPayload` is always an empt
 string. The calculation result in this example is
`99d58dfbc6745f6747f36bfca17dee5e6881dc0428a0a36f96199342bc5b4907`

According to the rules above, the `CanonicalRequest` string obtained in the example is as follows:

POST

/

content-type:application/json; charset=utf-8

host:cvm.tencentcloudapi.com

content-type;host

`99d58dfbc6745f6747f36bfca17dee5e6881dc0428a0a36f96199342bc5b4907`

2. Concatenating the String to Be Signed

The string to sign is concatenated as follows:

```
StringToSign =
Algorithm + \n +
RequestTimestamp + \n +
CredentialScope + \n +
HashedCanonicalRequest
```

Field Name	Explanation
Algorithm	Signature algorithm, which is currently always <code>TC3-HMAC-SHA256</code> .
RequestTimestamp	Request timestamp, i.e., the value of the common parameter <code>X-TC-Timestamp</code> in request header, which is the UNIX timestamp of the current time in seconds, such as <code>1551113065</code> in this example.
CredentialScope	Scope of the credential in the format of <code>Date/service/tc3_request</code> , including date, requested service and termination string (tc3_request). Date is a date in UTC time, whose value should match the UTC date converted by the common parameter X-TC-Timestamp ; <code>service</code> is the product name, which should match the domain name of the product called. The calculation result in this example is <code>20180525/cvm/tc3_request</code> .

HashedCanonicalRequest	Hash value of the CanonicalRequest string concatenated in the steps above. The pseudocode for calculation is Lowercase(HexEncode(Hash.SHA256(CanonicalRequest))) The calculation result in this example is 2815843035062fffd6f2a44ea8a34818b0dc46f024b8b3786976a3ad
------------------------	---

Note:

1. Date has to be calculated from the timestamp "X-TC-Timestamp" and the time zone is UTC+0. If you add the system's local time zone information (such as UTC+8), calls can succeed both day and night but will definitely fail at 00:00. For example, if the timestamp is 1551113065 and the time in UTC+8 is 2019-02-26 00:44:25, the UTC+0 date in the calculated Date value should be 2019-02-25 instead of 2019-02-26.
2. Timestamp must be the same as your current system time, and your system time and standard time must be synced; if the difference between Timestamp and your current system time is larger than five minutes, the request will fail. If your system time is out of sync with the standard time for a while, the request will fail and return a signature expiration error.

According to the preceding rules, the string to be signed obtained in the example is as follows:

```
TC3-HMAC-SHA256
1551113065
2019-02-25/cvm/tc3_request
2815843035062fffd6f2a44ea8a34818b0dc46f024b8b3786976a3adda7a
```

3. Calculating the Signature

1. Calculate the derived signature key with the following pseudocode:

```
SecretKey = "Gu5t9xGARNpq86cd98joQYCN3*****"
SecretDate = HMAC_SHA256("TC3" + SecretKey, Date)
SecretService = HMAC_SHA256(SecretDate, Service)
SecretSigning = HMAC_SHA256(SecretService, "tc3_request")
```

Field Name	Explanation
SecretKey	The original SecretKey, i.e., Gu5t9xGARNpq86cd98joQYCN3*****.
Date	The Date field information in Credential, such as 2019-02-25 in this example.

Service	Value in the Service field in <code>Credential</code> , such as <code>cvm</code> in this example.
---------	---

2. Calculate the signature with the following pseudocode:

```
Signature = HexEncode(HMAC_SHA256(SecretSigning, StringToSign))
```

4. Concatenating the Authorization

The Authorization is concatenated as follows:

```
Authorization =
Algorithm + ' ' +
'Credential=' + SecretId + '/' + CredentialScope + ', ' +
'SignedHeaders=' + SignedHeaders + ', ' +
'Signature=' + Signature
```

Field Name	Explanation
Algorithm	Signature algorithm, which is always <code>TC3-HMAC-SHA256</code> .
SecretId	The SecretId in the key pair, i.e., <code>AKIDz8krbsJ5yKBZQpn74WFkmLPx3*****</code> .
CredentialScope	Credential scope (see above). The calculation result in this example is <code>2019-02-25/cvm/tc3_request</code> .
SignedHeaders	Header information for signature calculation (see above), such as <code>content-type;host</code> in this example.
Signature	Signature value. The calculation result in this example is <code>c492e8e41437e97a620b728c301bb8d17e7dc0c17eeabce80c20cd70fc3a78ff</code> .

According to the rules above, the value obtained in the example is:

```
TC3-HMAC-SHA256 Credential=AKIDz8krbsJ5yKBZQpn74WFkmLPx3*****/2019-02-25/cvm/tc3_request, SignedHeaders=content-type;host, Signature=c492e8e41437e97a620b728c301bb8d17e7dc0c17eeabce80c20cd70fc3a78ff
```

The following example shows a finished authorization header:

```
POST https://cvm.tencentcloudapi.com/
Authorization: TC3-HMAC-SHA256 Credential=AKIDz8krbsJ5yKBZQpn74WFkmLPx3*****/2019-02-25/cvm/tc3_request, SignedHeaders=content-type;host, Signature=c492e8e41437e97a620b728c301bb8d17e7dc0c17eeabce80c20cd70fc3a78ff
```

```
Content-Type: application/json; charset=utf-8
Host: cvm.tencentcloudapi.com
X-TC-Action: DescribeInstances
X-TC-Version: 2017-03-12
X-TC-Timestamp: 1551113065
X-TC-Region: ap-guangzhou

{"Limit": 1, "Filters": [{"Values": ["unnamed"], "Name": "instance-name"}]}
```

5. Signature Demo

When calling API 3.0, you are recommended to use the corresponding Tencent Cloud SDK 3.0 which encapsulates the signature process, enabling you to focus on only the specific APIs provided by the product when developing. See [SDK Center](#) for more information. Currently, the following programming languages are supported:

- [Python](#)
- [Java](#)
- [PHP](#)
- [Go](#)
- [NodeJS](#)
- [.NET](#)

To further explain the signing process, we will use a programming language to implement the process described above. The request domain name, API and parameter values in the sample are used here. This goal of this example is only to provide additional clarification for the signature process, please see the SDK for actual usage.

The final output URL might be: `https://cvm.tencentcloudapi.com/?Action=DescribeInstances&InstanceIds.0=ins-09dx96dg&Limit=20&Nonce=11886&Offset=0&Region=ap-guangzhou&SecretId=AKIDz8krbsJ5yKBZQpn74WFkmLPx3*****&Signature=EliP9YW3pW28FpsEdkXt%2F%2BWcGel%3D&Timestamp=1465185768&Version=2017-03-12.`

Note: The key in the example is fictitious, and the timestamp is not the current time of the system, so if this URL is opened in the browser or called using commands such as curl, an authentication error will be returned: Signature expired. In order to get a URL that can work properly, you need to replace the SecretId and SecretKey in the example with your real credentials and use the current time of the system as the Timestamp.

Note: In the example below, even if you use the same programming language, the order of the parameters in the URL may be different for each execution. However, the order does not matter, as long as all the parameters are included in the URL and the signature is calculated correctly.

Note: The following code is only applicable to API 3.0. It cannot be directly used in other signature processes. Even with an older API, signature calculation errors may occur due to the differences in details. Please refer to the corresponding documentation.

Signature Failure

The following situational error codes for signature failure may occur. Please resolve the errors accordingly.

Error Code	Description
AuthFailure.SignatureExpire	Signature expired. Timestamp and server time cannot differ by more than five minutes.
AuthFailure.SecretIdNotFound	The key does not exist. Please go to the console to check whether it is disabled or you copied fewer or more characters.
AuthFailure.SignatureFailure	Signature error. It is possible that the signature was calculated incorrectly, the signature does not match the content actually sent, or the SecretKey is incorrect.
AuthFailure.TokenFailure	Temporary certificate token error.
AuthFailure.InvalidSecretId	Invalid key (not a TencentCloud API key type).

Signature

最近更新时间：2022-03-28 10:56:52

Tencent Cloud API authenticates each access request, i.e. each request needs to include authentication information (Signature) in the common parameters to verify the identity of the requester.

The Signature is generated by the security credentials which include SecretId and SecretKey. If you don't have the security credentials yet, go to the [TencentCloud API Key](#) page to apply for them; otherwise, you cannot invoke the TencentCloud API.

1. Applying for Security Credentials

Before using the TencentCloud API for the first time, go to the [TencentCloud API Key](#) page to apply for security credentials.

Security credentials consist of SecretId and SecretKey:

- SecretId is used to identify the API requester.
- SecretKey is used to encrypt the signature string and verify it on the server.
- **You must keep your security credentials private and avoid disclosure.**

You can apply for the security credentials through the following steps:

1. Log in to the [Tencent Cloud Console](#).
2. Go to the [TencentCloud API Key](#) page.
3. On the [API Key Management](#) page, click **Create Key** to create a SecretId/SecretKey pair.

Note: Each account can have up to two pairs of SecretId/SecretKey.

2. Generating a Signature

With the SecretId and SecretKey, a signature can be generated. The following describes how to generate a signature:

Assume that the SecretId and SecretKey are:

- SecretId: AKIDz8krbsJ5yKBZQpn74WFkmLPx3*****
- SecretKey: Gu5t9xGARNpq86cd98joQYCN3*****

Note: This is just an example. For actual operations, please use your own SecretId and SecretKey.

Take the Cloud Virtual Machine's request to view the instance list (DescribeInstances) as an example. When you invoke this API, the request parameters may be as follows:

Parameter name	Description	Parameter value
Action	Method name	DescribeInstances
SecretId	Key ID	AKIDz8krbsJ5yKBZQpn74WFkmLPx3*****
Timestamp	Current timestamp	1465185768
Nonce	Random positive integer	11886
Region	Region where the instance is located	ap-guangzhou
InstanceIds.0	ID of the instance to query	ins-09dx96dg
Offset	Offset	0
Limit	Allowed maximum output	20
Version	API version number	2017-03-12

2.1. Sorting Parameters

First, sort all the request parameters in an ascending lexicographical order (ASCII code) by their names. Notes: (1) Parameters are sorted by their names instead of their values; (2) The parameters are sorted based on ASCII code, not in an alphabetical order or by values. For example, InstanceIds.2 should be arranged after InstanceIds.12. You can complete the sorting process using a sorting function in a programming language, such as the ksort function in PHP. The parameters in the example are sorted as follows:

```
{
  'Action' : 'DescribeInstances',
  'InstanceIds.0' : 'ins-09dx96dg',
  'Limit' : 20,
  'Nonce' : 11886,
  'Offset' : 0,
  'Region' : 'ap-guangzhou',
  'SecretId' : 'AKIDz8krbsJ5yKBZQpn74WFkmLPx3*****',
  'Timestamp' : 1465185768,
  'Version' : '2017-03-12',
}
```

When developing in another programming language, you can sort these sample parameters and it will work as long as you obtain the same results.

2.2. Concatenating a Request String

This step generates a request string.

Format the request parameters sorted in the previous step into the form of "parameter name"="parameter value". For example, for the Action parameter, its parameter name is "Action" and its parameter value is "DescribeInstances", so it will become Action=DescribeInstances after formatted.

Note: The "parameter value" is the original value but not the value after URL encoding.

Then, concatenate the formatted parameters with "&". The resulting request string is as follows:

```
Action=DescribeInstances&InstanceIds.0=ins-09dx96dg&Limit=20&Nonce=11886&Offset=0
&Region=ap-guangzhou&SecretId=AKIDz8krbsJ5yKBZQpn74WFkmLPx3*****&Timestamp=1465
185768&Version=2017-03-12
```

2.3. Concatenating the Signature Original String

This step generates a signature original string.

The signature original string consists of the following parameters:

1. HTTP method: POST and GET modes are supported, and GET is used here for the request. Please note that the method name should be in all capital letters.
2. Request server: the domain name of the request to view the list of instances (DescribeInstances) is cvm.tencentcloudapi.com. The actual request domain name varies by the module to which the API belongs. For more information, see the instructions of the specific API.
3. Request path: The request path in the current version of TencentCloud API is fixed to /.
4. Request string: the request string generated in the previous step.

The concatenation rule of the signature original string is: Request method + request host + request path + ? + request string

The concatenation result of the example is:

```
GETcvm.tencentcloudapi.com/?Action=DescribeInstances&InstanceIds.0=ins-09dx96dg&L
imit=20&Nonce=11886&Offset=0&Region=ap-guangzhou&SecretId=AKIDz8krbsJ5yKBZQpn74WF
kmLPx3*****&Timestamp=1465185768&Version=2017-03-12
```

2.4. Generating a Signature String

This step generates a signature string.

First, use the HMAC-SHA1 algorithm to sign the **signature original string** obtained in the previous step, and then

encode the generated signature using Base64 to obtain the final signature.

The specific code is as follows with the PHP language being used as an example:

```
$secretKey = 'Gu5t9xGARNpq86cd98joQYCN3*****';  
$srcStr = 'GETcvm.tencentcloudapi.com/?Action=DescribeInstances&InstanceIds.0=ins  
-09dx96dg&Limit=20&Nonce=11886&Offset=0&Region=ap-guangzhou&SecretId=AKIDz8krbsJ5  
yKBZQpn74WFkmLPx3*****&Timestamp=1465185768&Version=2017-03-12';  
$signStr = base64_encode(hash_hmac('sha1', $srcStr, $secretKey, true));  
echo $signStr;
```

The final signature is:

```
zmmjn35mikh6pM3V7sUEuX4wyYM=
```

When developing in another programming language, you can sign and verify the original in the example above and it works as long as you get the same results.

3. Encoding a Signature String

The generated signature string cannot be directly used as a request parameter and must be URL encoded.

For example, if the signature string generated in the previous step is `zmmjn35mikh6pM3V7sUEuX4wyYM=`, the final signature string request parameter (Signature) is `zmmjn35mikh6pM3V7sUEuX4wyYM%3D`, which will be used to generate the final request URL.

Note: If your request method is GET, or the request method is POST and the Content-Type is application/x-www-form-urlencoded, then all the request parameter values need to be URL encoded (except the parameter key and the symbol of =) when sending the request. Non-ASCII characters need to be encoded with UTF-8 before URL encoding.

Note: The network libraries of some programming languages automatically URL encode all parameters, in which case there is no need to URL encode the signature string; otherwise, two rounds of URL encoding will cause the signature to fail.

Note: Other parameter values also need to be encoded using [RFC 3986](#). Use %XY in percent-encoding for special characters such as Chinese characters, where "X" and "Y" are hexadecimal characters (0-9 and uppercase A-F), and using lowercase will cause an error.

4. Signature Failure

The following situational error codes for signature failure may occur. Please resolve the errors accordingly.

Error code	Error description
AuthFailure.SignatureExpire	The signature is expired
AuthFailure.SecretIdNotFound	The key does not exist
AuthFailure.SignatureFailure	Signature error
AuthFailure.TokenFailure	Token error
AuthFailure.InvalidSecretId	Invalid key (not a TencentCloud API key type)

5. Signature Demo

When calling API 3.0, you are recommended to use the corresponding Tencent Cloud SDK 3.0 which encapsulates the signature process, enabling you to focus on only the specific APIs provided by the product when developing. See [SDK Center](#) for more information. Currently, the following programming languages are supported:

- [Python](#)
- [Java](#)
- [PHP](#)
- [Go](#)
- [NodeJS](#)
- [.NET](#)

To further explain the signing process, we will use a programming language to implement the process described above. The request domain name, API and parameter values in the sample are used here. This goal of this example is only to provide additional clarification for the signature process, please see the SDK for actual usage.

The final output URL might be: `https://cvm.tencentcloudapi.com/?Action=DescribeInstances&InstanceIds.0=ins-09dx96dg&Limit=20&Nonce=11886&Offset=0&Region=ap-guangzhou&SecretId=AKIDz8krbsJ5yKBZQpn74WFkmLPx3*****&Signature=zmmjn35mikh6pM3V7sUEuX4wyYM%3D&Timestamp=1465185768&Version=2017-03-12` .

Note: The key in the example is fictitious, and the timestamp is not the current time of the system, so if this URL is opened in the browser or called using commands such as curl, an authentication error will be returned: Signature expired. In order to get a URL that can work properly, you need to replace the SecretId and SecretKey in the example with your real credentials and use the current time of the system as the Timestamp.

Note: In the example below, even if you use the same programming language, the order of the parameters in the URL may be different for each execution. However, the order does not matter, as long as all the parameters are included in the URL and the signature is calculated correctly.

Note: The following code is only applicable to API 3.0. It cannot be directly used in other signature processes. Even with an older API, signature calculation errors may occur due to the differences in details. Please refer to the corresponding documentation.

Java

```
import java.io.UnsupportedEncodingException;
import java.net.URLEncoder;
import java.util.Random;
import java.util.TreeMap;
import javax.crypto.Mac;
import javax.crypto.spec.SecretKeySpec;
import javax.xml.bind.DatatypeConverter;

public class TencentCloudAPIDemo {
    private final static String CHARSET = "UTF-8";

    public static String sign(String s, String key, String method) throws Exception {
        Mac mac = Mac.getInstance(method);
        SecretKeySpec secretKeySpec = new SecretKeySpec(key.getBytes(CHARSET), mac.getAlgorithm());
        mac.init(secretKeySpec);

Responses

最近更新时间：2022-03-28 10:56:52

Response for Successful Requests

For example, when calling CAM API (version: 2017-03-12) to view the status of instances (DescribeInstancesStatus), if the request has succeeded, you may see the response as shown below:

```
{
  "Response": {
    "TotalCount": 0,
    "InstanceStatusSet": [],
    "RequestId": "b5b41468-520d-4192-b42f-595cc34b6c1c"
  }
}
```

- The API will return `Response`, which contains `RequestId`, as long as it processes the request. It does not matter if the request is successful or not.
- `RequestId` is the unique ID of an API request. Contact us with this ID when an exception occurs.
- Except for the fixed fields, all fields are action-specified. For the definitions of action-specified fields, see the corresponding API documentation. In this example, `TotalCount` and `InstanceStatusSet` are the fields specified by the API `DescribeInstancesStatus`. `0` `TotalCount` means that the requester owns 0 CVM instance so the `InstanceStatusSet` is empty.

Response for Failed Requests

If the request has failed, you may see the response as shown below:

```
{
  "Response": {
    "Error": {
      "Code": "AuthFailure.SignatureFailure",
      "Message": "The provided credentials could not be validated. Please ensure your signature is correct."
    },
    "RequestId": "ed93f3cb-f35e-473f-b9f3-0d451b8b79c6"
  }
}
```

- The presence of the `Error` field indicates that the request has failed. A response for a failed request will include `Error`, `Code` and `Message` fields.
- `Code` is the code of the error that helps you identify the cause and solution. There are two types of error codes so you may find the code in either common error codes or API-specified error codes.
- `Message` explains the cause of the error. Note that the returned messages are subject to service updates. The information the messages provide may not be up-to-date and should not be the only source of reference.
- `RequestId` is the unique ID of an API request. Contact us with this ID when an exception occurs.

Common Error Codes

If there is an `Error` field in the response, it means that the API call failed. The `Code` field in `Error` indicates the error code. The following table lists the common error codes that all actions can return.

Error Code	Description
<code>AuthFailure.InvalidSecretId</code>	Invalid key (not a TencentCloud API key type).
<code>AuthFailure.MFAFailure</code>	MFA failed.
<code>AuthFailure.SecretIdNotFound</code>	The key does not exist.
<code>AuthFailure.SignatureExpire</code>	Signature expired.
<code>AuthFailure.SignatureFailure</code>	Signature error.
<code>AuthFailure.TokenFailure</code>	Token error.
<code>AuthFailure.UnauthorizedOperation</code>	The request does not have CAM authorization.
<code>DryRunOperation</code>	DryRun Operation. It means that the request would have succeeded, but the <code>DryRun</code> parameter was used.
<code>FailedOperation</code>	Operation failed.
<code>InternalError</code>	Internal error.
<code>InvalidAction</code>	The API does not exist.
<code>InvalidParameter</code>	Incorrect parameter.
<code>InvalidParameterValue</code>	Invalid parameter value.
<code>LimitExceeded</code>	Quota limit exceeded.
<code>MissingParameter</code>	A parameter is missing.

NoSuchVersion	The API version does not exist.
RequestLimitExceeded	The number of requests exceeds the frequency limit.
ResourceInUse	Resource is in use.
ResourceInsufficient	Insufficient resource.
ResourceNotFound	The resource does not exist.
ResourceUnavailable	Resource is unavailable.
UnauthorizedOperation	Unauthorized operation.
UnknownParameter	Unknown parameter.
UnsupportedOperation	Unsupported operation.
UnsupportedProtocol	HTTPS request method error. Only GET and POST requests are supported.
UnsupportedRegion	API does not support the requested region.

Image Moderation APIs

ImageModeration

最近更新时间：2023-04-03 15:52:18

1. API Description

Domain name for API request: ims.tencentcloudapi.com.

This API is used to submit an image for smart moderation. Before using it, you need to log in to the console with the Tencent Cloud root account [to activate IMS](#) and adjust the business configuration.

API use instructions

- Go to the "[CMS console - IMS](#)" to activate IMS.
- This API is a paid API.

API feature description

- It can detect images or links and recognize content that may be offensive, unsafe, or inappropriate based on the deep learning technology;
- It can capture frames from or split GIF/long images for detection;
- It can recognize various non-compliant scenarios, including vulgarity, law or regulation violations, pornography, and advertising;
- It can detect multiple types of objects (such as object, advertising logo, and QR code) and recognize text in images based on OCR;
- It allows you to customize moderation policies based on different business scenarios;
- You can select image risk libraries to filter non-compliant images of custom types (currently, only blacklist configuration is supported);
- You can associate account or device information when moderating an image to recognize the account or device involved.

API call description

- Supported image file size: **< 5 MB**
- Supported image file resolution: **a resolution of 256x256 or higher** is recommended; otherwise, the recognition effect may be affected.
- Supported image file formats: PNG, JPG, JPEG, BMP, GIF, and WEBP.
- Supported image URL transfer protocols: HTTP and HTTPS.

- If you pass in the access URL of an image, you need to **limit the image download time to 3 seconds**. To ensure the stability and reliability of the image to be detected, we recommend you use Tencent Cloud COS for storage or CDN for caching.
- Default API request rate limit: **100 requests/sec**. If this limit is exceeded, an error will be reported.

Version iteration description

The version described on this page is 2020. The IMS APIs connected to before November 3, 2020 are on v2019, and you can directly access the following URL to perform maintenance operations: IMS APIs v2019

v2020 is an upgrade to v2019 to support more flexible multi-scenario business policy configuration and richer recognition callback information, meeting the recognition requirements of different businesses. We recommend you upgrade the APIs according to the v2020 connection guide. Meanwhile, we will continue to maintain v2019 until users no longer use it.

A maximum of 100 requests can be initiated per second for this API.

We recommend you to use API Explorer

[Try it](#)

API Explorer provides a range of capabilities, including online call, signature authentication, SDK code generation, and API quick search. It enables you to view the request, response, and auto-generated examples.

2. Input Parameters

The following request parameter list only provides API request parameters and some common parameters. For the complete common parameter list, see [Common Request Parameters](#).

Parameter Name	Required	Type	Description
Action	Yes	String	Common Params . The value used for this API: ImageModeration.
Version	Yes	String	Common Params . The value used for this API: 2020-12-29.
Region	Yes	String	Common Params . For more information, please see the list of regions supported by the product.

Parameter Name	Required	Type	Description
BizType	No	String	<p>This field indicates the specific number of the policy, which is used for API scheduling and can be configured in the CMS console. If the <code>Biztype</code> parameter is passed in, a moderation policy will be used based on the business scenario; otherwise, the default moderation policy will be used.</p> <p>Note: <code>Biztype</code> can contain 3–32 digits, letters, and underscores; different <code>Biztype</code> values are associated with different business scenarios and moderation policies, so you need to verify the <code>Biztype</code> before calling this API.</p>
DataId	No	String	<p>This field indicates the data ID assigned by you to the object to be detected for easier file identification and management.</p> <p>It can contain up to 64 letters, digits, and special symbols (_ - @#).</p>
FileContent	No	String	<p>This field indicates the Base64 encoding of the image to be detected. The image size cannot exceed 5 MB. A resolution of 256x256 or higher is recommended; otherwise, the recognition effect may be affected.</p> <p>Note: you must enter a value for either this field or <code>FileUrl</code> .</p>
FileUrl	No	String	<p>URL of the image to moderate. It supports PNG, JPG, JPEG, BMP, GIF AND WEBP files. The file cannot exceed 5 MB and the resolution should not below *256246**. The default timeout period is 3 seconds. Note that redirection URLs may be blocked by security policies. In this case, an error message will return. For example, if an HTTP request gets the 302 code, the error <code>ResourceUnavailable.ImageDownloadError</code> is returned.</p> <p>**Either <code>FileUrl</code> or <code>FileContent</code> must be specified.</p>
Interval	No	Integer	<p>For GIF/long image detection only. This field indicates the GIF frame capturing frequency (the image interval for capturing a frame for detection). For long images, you should round the width:height ratio as the total number of images to be split. The default value is 0, where only the first frame of the GIF image will be detected, and the long image will not be split.</p> <p>Note: the <code>Interval</code> and <code>MaxFrames</code> parameters need to be used in combination; for example, if <code>Interval</code> is 3 and <code>MaxFrames</code> is 400 , the GIF/long image will be detected once every two frames for up to 400 frames.</p>

Parameter Name	Required	Type	Description
MaxFrames	No	Integer	<p>For GIF/long image detection only. This field indicates the maximum number of frames that can be captured. The default value is 1, where only the first frame of the input GIF image will be detected, and the long image will not be split (which may cause a processing timeout).</p> <p>Note: the <code>Interval</code> and <code>MaxFrames</code> parameters need to be used in combination; for example, if <code>Interval</code> is 3 and <code>MaxFrames</code> is 400, the GIF/long image will be detected once every two frames for up to 400 frames.</p>
User	No	User	This field indicates the information of the user that corresponds to the object to be detected. It can be passed in to identify the user involved in the violation.
Device	No	Device	This field indicates the information of the device that corresponds to the object to be detected. It can be passed in to identify the device involved in the violation.

3. Output Parameters

Parameter Name	Type	Description
Suggestion	String	<p>This field is used to return the operation suggestion for the <code>Label</code> tag. When you get the determination result, the returned value indicates the operation suggested by the system. We recommend you handle different types of violations and suggestions according to your business needs.</p> <p>Returned values: Block, Review, Pass.</p>
Label	String	<p>This field is used to return the maliciousness tag with the highest priority in the detection result (<code>LabelResults</code>), which represents the moderation result suggested by the model. We recommend you handle different types of violations and suggestions according to your business needs.</p> <p>Returned values: Normal: normal; Porn: pornographic; Abuse: abusive; Ad: advertising; Custom: custom type of non-compliant content and other offensive, unsafe, or inappropriate types of content.</p>

Parameter Name	Type	Description
SubLabel	String	This field is used to return the subtag name under the maliciousness tag with the highest priority hit by the detection result, such as <i>Porn-SexBehavior</i> . If no subtag is hit, an empty string will be returned.
Score	Integer	Confidence score of the under the current label. Value range: 0 (the lowest confidence) to 100 (the highest confidence). For example, <i>Porn 99</i> indicates that the image is highly likely to be pornographic, while <i>Porn 0</i> indicates that the image is not pornographic.
LabelResults	Array of LabelResult	This field is used to return the detailed recognition result for the maliciousness tag hit by the categorization model, such as porn, advertising, or any other offensive, unsafe, or inappropriate type of content. Note: this field may return null, indicating that no valid values can be obtained.
ObjectResults	Array of ObjectResult	This field is used to return the detailed detection result of the object detection model, including the tag name hit by the content such as object, advertising logo, or QR code, tag score, coordinate information, scenario recognition result, and operation suggestion. For more information on the returned value, see the description of the <code>ObjectResults</code> data structure. Note: this field may return null, indicating that no valid values can be obtained.
OcrResults	Array of OcrResult	This field is used to return the detailed text OCR result, including the text coordinate information, text recognition result, and operation suggestion. For more information on the returned value, see the description of the <code>OcrResults</code> data structure. Note: this field may return null, indicating that no valid values can be obtained.
LibResults	Array of LibResult	This field is used to return the result of recognition based on image risk libraries (blocklist and allowlist). For more information on the returned value, see the description of the <code>LibResults</code> data structure. Note: currently, you cannot customize image risk libraries . Note: this field may return null, indicating that no valid values can be obtained.
DataId	String	This field is used to return the <code>DataId</code> in the request parameters that correspond to the detected object.

Parameter Name	Type	Description
BizType	String	This field is used to return the <code>BizType</code> in the request parameters that correspond to the detected object.
Extra	String	This field is used to return the additional information (Extra) configured based on your needs. If it is not configured, an empty value will be returned by default. Note: the returned information varies by customer or <code>Biztype</code> . If you need to configure this field, submit a ticket or contact the aftersales service for assistance. Note: this field may return null, indicating that no valid values can be obtained.
FileMD5	String	This field is used to return the MD5 checksum of the detected object for easier verification of the file integrity.
RecognitionResults	Array of RecognitionResult	Image recognition result, including the hit tags, confidence and location. Note: This field may return <code>null</code> , indicating that no valid values can be obtained.
RequestId	String	The unique request ID, which is returned for each request. RequestId is required for locating a problem.

4. Example

Example1 Moderating image

This example shows you how to moderate an image.

Input Example

```
POST / HTTP/1.1
Host: ims.tencentcloudapi.com
Content-Type: application/json
X-TC-Action: ImageModeration
<common request parameters>

{
  "BizType": "test_1001",
  "DataId": "1213",
  "FileUrl": "https://xxx.jpg"
}
```

5. Developer Resources

SDK

TencentCloud API 3.0 integrates SDKs that support various programming languages to make it easier for you to call APIs.

- [Tencent Cloud SDK 3.0 for Python](#)
- [Tencent Cloud SDK 3.0 for Java](#)
- [Tencent Cloud SDK 3.0 for PHP](#)
- [Tencent Cloud SDK 3.0 for Go](#)
- [Tencent Cloud SDK 3.0 for NodeJS](#)
- [Tencent Cloud SDK 3.0 for .NET](#)
- [Tencent Cloud SDK 3.0 for C++](#)

Command Line Interface

- [Tencent Cloud CLI 3.0](#)

6. Error Code

The following only lists the error codes related to the API business logic. For other error codes, see [Common Error Codes](#).

Error Code	Description
DryRunOperation	<code>DryRun</code> Operation. It means that the request would have succeeded, but the <code>DryRun</code> parameter was used.
FailedOperation	The operation failed.
InternalServerError	An internal error occurred.
InternalServerError.InternalError	An internal error occurred.
InvalidParameter	The parameter is incorrect.
InvalidParameter.ImageSizeTooSmall	The image resolution is too low.
InvalidParameter.InvalidImageContent	The image content is incorrect.
InvalidParameter.InvalidParameter	The parameter is invalid.
InvalidParameterValue	The parameter value is incorrect.
InvalidParameterValue.EmptyImageContent	The image content parameter is empty.
InvalidParameterValue.ImageSizeTooSmall	The image resolution is too low.
InvalidParameterValue.InvalidContent	<code>FileContent</code> and <code>FileUrl</code> are empty.
InvalidParameterValue.InvalidDataId	The <code>DataId</code> format is incorrect.
InvalidParameterValue.InvalidFileContentSize	The image file content size is exceptional.
InvalidParameterValue.InvalidImageContent	The image content is incorrect.
InvalidParameterValue.InvalidParameter	The parameter value is incorrect.
LimitExceeded	The quota limit is exceeded.
MissingParameter	The parameter is missing.
OperationDenied	The operation was denied.
RequestLimitExceeded	The number of requests exceeds the frequency limit.

Error Code	Description
ResourceInUse	The resource is in use.
ResourceInsufficient	The resource is insufficient.
ResourceNotFound	The resource does not exist.
ResourceUnavailable	The resource is unavailable.
ResourceUnavailable.ImageDownloadError	Image file download failed.
ResourceUnavailable.InvalidImageContent	The image resource is incorrect.
ResourcesSoldOut	The resources have been sold out.
UnauthorizedOperation	The operation is unauthorized.
UnauthorizedOperation.Unauthorized	Operation not authorized/No valid package/The account is overdue
UnknownParameter	The parameter is unknown.
UnsupportedOperation	The operation is not supported.

Data Types

最近更新时间：2023-03-24 17:18:29

Device

Indicates the information of the business user's device

Used by actions: ImageModeration.

Name	Type	Required	Description
Ip	String	No	This field indicates the IP address of the business user's device and supports recording both IPv4 and IPv6 addresses. It needs to be used together with the <code>IpType</code> parameter.
Mac	String	No	This field indicates the MAC address of the business user, which makes it easier to identify and manage devices. Its format and value are the same as those of a standard MAC address.
TokenId	String	No	<i>In beta test. Stay tuned.</i>
DeviceId	String	No	<i>In beta test. Stay tuned.</i>
IMEI	String	No	This field indicates the international mobile equipment identity (IMEI) number of the business user's device, which can be used to identify each mobile communication device such as mobile phone for easier device identification and management. Note: the format is 15–17 digits .
IDFA	String	No	For iOS devices: this field indicates the identifier for advertisers (IDFA) of the business user, which is provided by Apple to identify the user and contains a hexadecimal string of 32 digits and letters. Note: as iOS 14 has been updated by Apple to allow users to manually enable or disable IDFA since 2021, the validity of this string may be reduced.
IDFV	String	No	For iOS devices: this field indicates the identifier for vendors (IDFV) of the business user, which is provided by Apple to identify the app vendor and contains a hexadecimal string of 32 digits and letters. It can be used to uniquely identify a device.
IpType	Integer	No	This field indicates the type of the recorded IP address. Valid values: 0 (IPv4 address), 1 (IPv6 address). It needs to be used together with the

IpType parameter.

LabelDetailItem

Returns the details of the subtag hit by the categorization model

Used by actions: ImageModeration.

Name	Type	Description
Id	Integer	This field is used to return the ID of the recognized object for easier recognition and distinction. Note: this field may return null, indicating that no valid values can be obtained.
Name	String	This field is used to return the hit subtag name. Note: this field may return null, indicating that no valid values can be obtained.
Score	Integer	This field is used to return the hit score of the subtag. Value range: 0–100 ; for example, <i>Porn-SexBehavior 99</i> indicates that the hit score of the <i>Porn-SexBehavior</i> tag for the recognized content is 99. Note: this field may return null, indicating that no valid values can be obtained.

LabelResult

Hit result of the categorization model

Used by actions: ImageModeration.

Name	Type	Description
Scene	String	This field is used to return the scenario result recognized by the model, such as advertising, pornographic, and harmful.
Suggestion	String	This field is used to return the operation suggestion for the current maliciousness tag. When you get the determination result, the returned value indicates the operation suggested by the system. We recommend you handle different types of violations and suggestions according to your business needs. Returned values: Block , Review , Pass .
Label	String	This field is used to return the maliciousness tag in the detection result. Returned values: Normal : normal; Porn : pornographic; Abuse : abusive; Ad :

		advertising; Custom : custom type of non-compliant content and other offensive, unsafe, or inappropriate types of content.
SubLabel	String	This field is used to return the detection result for a subtag under the maliciousness tag, such as <i>Porn-SexBehavior</i> .
Score	Integer	Confidence score of the under the current label. Value range: 0 (the lowest confidence) to 100 (the highest confidence). For example, <i>Porn 99</i> indicates that the image is highly likely to be pornographic, while <i>Porn 0</i> indicates that the image is not pornographic.
Details	Array of LabelDetailItem	This field is used to return the details of the subtag hit by the categorization model, such as number, hit tag name, and score. Note: this field may return null, indicating that no valid values can be obtained.

LibDetail

Returns the details of the custom library/blocklist/allowlist

Used by actions: ImageModeration.

Name	Type	Description
Id	Integer	This field is used to return the ID of the recognized object for easier recognition and distinction.
LibId	String	This field is valid only when Label is Custom (custom keyword) . It is used to return the ID of the custom library for easier custom library management and configuration.
LibName	String	This field is valid only when Label is Custom (custom keyword) . It is used to return the name of the custom library for easier custom library management and configuration. Note: this field may return null, indicating that no valid values can be obtained.
ImageId	String	This field is used to return the ID of the recognized image object for easier file management.
Label	String	This field is used to return the maliciousness tag in the detection result. Returned values: Normal : normal; Porn : pornographic; Abuse : abusive; Ad : advertising; Custom : custom type of non-compliant content and other offensive, unsafe, or inappropriate types of content.
Tag	String	This field is used to return other custom tags to meet the needs in your customized

		scenarios. It can be skipped if you have no custom needs. Note: this field may return null, indicating that no valid values can be obtained.
Score	Integer	This field is used to return the hit score of the model. Value range: 0–100 ; for example, <i>Porn 99</i> indicates that the hit score of the porn tag for the recognized content is 99.

LibResult

Returns the detailed result of the comparison with the blacklist/allowlist

Used by actions: ImageModeration.

Name	Type	Description
Scene	String	This field indicates the scenario recognition result of the model. Default value: Similar.
Suggestion	String	This field is used to return the operation suggestion. When you get the determination result, the returned value indicates the operation suggested by the system. We recommend you handle different types of violations and suggestions according to your business needs. Returned values: Block , Review , Pass .
Label	String	This field is used to return the maliciousness tag in the detection result. Returned values: Normal : normal; Porn : pornographic; Abuse : abusive; Ad : advertising; Custom : custom type of non-compliant content and other offensive, unsafe, or inappropriate types of content.
SubLabel	String	This field is used to return the detection result for a subtag under the maliciousness tag, such as <i>Porn-SexBehavior</i> . Note: this field may return null, indicating that no valid values can be obtained.
Score	Integer	This field is used to return the recognition score of the image search model. Value range: 0–100 . It indicates the score for the similarity between the moderated image and the samples in the library . A higher score indicates that the content is more likely to hit a sample in the library of similar images.
Details	Array of LibDetail	This field is used to return the detailed result of the comparison with the blacklist/allowlist, such as number, library name, and maliciousness tag. For more information on the returned value, see the description of the LibDetail data structure. Note: this field may return null, indicating that no valid values can be obtained.

Location

Coordinate

Used by actions: ImageModeration.

Name	Type	Description
X	Float	This parameter is used to return the pixel position of the abscissa (X) of the top-left corner of the detection frame. It can be combined with other parameters to uniquely determine the size and position of the detection frame.
Y	Float	This parameter is used to return the pixel position of the ordinate of the top-left corner (Y) of the detection frame. It can be combined with other parameters to uniquely determine the size and position of the detection frame.
Width	Float	This parameter is used to return the width of the detection frame (the length starting from the top-left corner and extending to the right on the X axis). It can be combined with other parameters to uniquely determine the size and position of the detection frame.
Height	Float	This parameter is used to return the height of the detection frame (the length starting from the top-left corner and extending down the Y axis). It can be combined with other parameters to uniquely determine the size and position of the detection frame.
Rotate	Float	This parameter is used to return the rotation angle of the detection frame . Valid values: 0–360 (degrees) , and the direction is counterclockwise rotation . This parameter can be combined with the <code>X</code> and <code>Y</code> coordinate parameters to uniquely determine the specific position of the detection frame.

ObjectDetail

Object detection result details. When the detection scenario is an object, advertising logo, or QR code, it represents the tag name, tag value, tag score, and position information of the model detection frame.

Used by actions: ImageModeration.

Name	Type	Description
Id	Integer	This parameter is used to return the ID of the recognized object for easier recognition and distinction.
Name	String	This parameter is used to return the hit object tag.
Value	String	This parameter is used to return the value or content of the object tag; for example, when the tag is <i>QR code (QrCode)</i> , this field will be the URL of the recognized QR code.

Score	Integer	This parameter is used to return the hit score of the object tag. Valid values: 0–100 ; for example, <i>QRCode 99</i> indicates that it is highly likely that the recognized content will hit the QR code tag.
Location	Location	This field is used to return the coordinate position (X and Y coordinates of the top-left corner, length, width, and rotation angle) of the object detection frame for quick location of the object information.
SubLabel	String	This parameter is used to return the hit object subtag.

ObjectResult

Returns object detection result details

Used by actions: ImageModeration.

Name	Type	Description
Scene	String	This field is used to return the recognized object scenario result, such as QR code, logo, and image OCR.
Suggestion	String	This field is used to return the operation suggestion for the current maliciousness tag. When you get the determination result, the returned value indicates the operation suggested by the system. We recommend you handle different types of violations and suggestions according to your business needs. Returned values: Block , Review , Pass .
Label	String	This field is used to return the maliciousness tag in the detection result, which represents the moderation result suggested by the model. We recommend you handle different types of violations and suggestions according to your business needs. Returned values: Normal : normal; Porn : pornographic; Abuse : abusive; Ad : advertising; Custom : custom type of non-compliant content and other offensive, unsafe, or inappropriate types of content.
SubLabel	String	This field is used to return the detection result for a subtag under the current maliciousness tag, such as <i>Porn-SexBehavior</i> .
Score	Integer	This field is used to return the hit score of a subtag under the current maliciousness tag. Value range: 0–100 ; for example, <i>Porn-SexBehavior 99</i> indicates that the hit score of the <i>Porn-SexBehavior</i> tag for the recognized content is 99.
Names	Array of String	This field is used to return the name of the recognized object. Note: this field may return null, indicating that no valid values can be obtained.

Details	Array of ObjectDetail	<p>This field is used to return the details of the recognized object, such as number, hit tag name, and position coordinates. For more information on the returned value, see the description of the ObjectDetail data structure.</p> <p>Note: this field may return null, indicating that no valid values can be obtained.</p>
---------	---------------------------------------	---

OcrResult

Returns OCR detection result details

Used by actions: ImageModeration.

Name	Type	Description
Scene	String	This field indicates the recognition scenario. Default value: OCR (image OCR).
Suggestion	String	<p>This field is used to return the operation suggestion for the maliciousness tag with the highest priority. When you get the determination result, the returned value indicates the operation suggested by the system. We recommend you handle different types of violations and suggestions according to your business needs.</p> <p>Returned values: Block, Review, Pass.</p>
Label	String	<p>This field is used to return the maliciousness tag with the highest priority in the OCR detection result, which represents the moderation result suggested by the model. We recommend you handle different types of violations and suggestions according to your business needs.</p> <p>Returned values: Normal: normal; Porn: pornographic; Abuse: abusive; Ad: advertising; Custom: custom type of non-compliant content and other offensive, unsafe, or inappropriate types of content.</p>
SubLabel	String	This field is used to return the detection result for a subtag under the current tag (Label), such as <i>Porn-SexBehavior</i> .
Score	Integer	This field is used to return the confidence under the current tag (Label). Value range: 0 (the lowest confidence)-100 (the highest confidence), where a higher value indicates that the text is more likely to fall into the category of the current returned tag; for example, <i>Porn 99</i> indicates that the text is highly likely to be pornographic, while <i>Porn 0</i> indicates that the text is not pornographic.
Details	Array of OcrTextDetail	<p>This field is used to return the details of the OCR recognition result, such as text content, tag, and recognition frame position.</p> <p>Note: this field may return null, indicating that no valid values can be obtained.</p>
Text	String	This field is used to return the text information recognized by OCR.

OcrTextDetail

This field is used to return the OCR text result details. More text in the image may increase the time it takes the API to return the result.

Used by actions: ImageModeration.

Name	Type	Description
Text	String	This field is used to return the text content recognized by OCR. Note: OCR can recognize text of up to 5,000 bytes .
Label	String	This field is used to return the maliciousness tag in the detection result. Returned values: Normal : normal; Porn : pornographic; Abuse : abusive; Ad : advertising; Custom : custom type of non-compliant content and other offensive, unsafe, or inappropriate types of content.
LibId	String	This field is valid only when Label is Custom (custom keyword) . It is used to return the ID of the custom library for easier custom library management and configuration.
LibName	String	This field is valid only when Label is Custom (custom keyword) . It is used to return the name of the custom library for easier custom library management and configuration.
Keywords	Array of String	This parameter is used to return the hit keyword under the current tag (label).
Score	Integer	This parameter is used to return the model hit score of the current maliciousness tag. Value range: 0–100 , where a higher value indicates that the current scenario agrees more with the scenario represented by the maliciousness tag.
Location	Location	This parameter is used to return the position (X and Y coordinates of the top-left corner, length, width, and rotation angle) of the OCR detection frame in the image for quick location of the recognized text.
Rate	Integer	This parameter is used to return the confidence of the text OCR result. Valid values: 0 (the lowest confidence)–100 (the highest confidence) , where a higher value indicates that it is more likely that the image contains the recognized text; for example, <i>Hello 99</i> indicates that it is highly likely that the text in the OCR recognition frame is "Hello".
SubLabel	String	This field is used to return the maliciousness subtag that corresponds to the detection result.

RecognitionResult

Label of the identification moderation result

Used by actions: ImageModeration.

Name	Type	Description
Label	String	Value: <code>Scene</code> Note: This field may return <code>null</code> , indicating that no valid values can be obtained.
Tags	Array of RecognitionTag	Hit tags under the <code>Label</code> Note: This field may return <code>null</code> , indicating that no valid values can be obtained.

RecognitionTag

Recognition tag information

Used by actions: ImageModeration.

Name	Type	Description
Name	String	Tag name Note: This field may return <code>null</code> , indicating that no valid values can be obtained.
Score	Integer	Confidence score. Value: 1 to 100. Note: This field may return <code>null</code> , indicating that no valid values can be obtained.
Location	Location	Location information. It returns 0 if there is not location information. Note: This field may return <code>null</code> , indicating that no valid values can be obtained.

User

Indicates the information of the business user's account

Used by actions: ImageModeration.

Name	Type	Required	Description
UserId	String	No	This field indicates the business user ID. After it is specified, the

			system can optimize the moderation result according to the violation history to facilitate determination when a suspicious violation risk exists.
Nickname	String	No	This field indicates the nickname of the business user's account.
AccountType	String	No	This field indicates the account type of the business user ID. This field can be used together with the ID parameter (UserId) to uniquely identify the account.
Gender	Integer	No	This field indicates the gender of the business user's account. Valid values: 0 (default value): unknown; 1 (male); 2 (female).
Age	Integer	No	This field indicates the age of the business user's account. Valid values: integers between 0 (default value, which indicates unknown) and custom age limit .
Level	Integer	No	This field indicates the level of the business user's account. Valid values: 0 (default value): unknown; 1 : low level; 2 : medium level; 3 : high level. Currently, the level is not customizable .
Phone	String	No	This field indicates the mobile number of the business user's account. It supports recording mobile numbers across the world. Note: you need to use a consistent mobile number format, such as area code format (086/+86).
Desc	String	No	This field indicates the profile of the business user. It can contain up to 5,000 letters and special symbols .
HeadUrl	String	No	This field indicates the access URL of the business user's profile photo in PNG, JPG, JPEG, BMP, GIF, or WEBP format. Note: the profile photo cannot exceed 5 MB in size. A resolution of 256x256 or higher is recommended. The image download time should be limited to 3 seconds; otherwise, a download timeout will be returned.

Error Codes

最近更新时间：2023-03-24 17:18:29

Feature Description

If there is an Error field in the response, it means that the API call failed. For example:

```
{
  "Response": {
    "Error": {
      "Code": "AuthFailure.SignatureFailure",
      "Message": "The provided credentials could not be validated. Please check your signature is correct."
    },
    "RequestId": "ed93f3cb-f35e-473f-b9f3-0d451b8b79c6"
  }
}
```

Code in Error indicates the error code, and Message indicates the specific information of the error.

Error Code List

Common Error Codes

Error Code	Description
ActionOffline	This API has been deprecated.
AuthFailure.InvalidAuthorization	<code>Authorization</code> in the request header is invalid.
AuthFailure.InvalidSecretId	Invalid key (not a TencentCloud API key type).
AuthFailure.MFAFailure	MFA failed.
AuthFailure.SecretIdNotFound	Key does not exist. Check if the key has been deleted or disabled in the console, and if not, check if the key is correctly entered. Note that whitespaces should not exist before or after the key.
AuthFailure.SignatureExpire	Signature expired. Timestamp and server time cannot differ by more than five minutes. Please

	ensure your current local time matches the standard time.
AuthFailure.SignatureFailure	Invalid signature. Signature calculation error. Please ensure you've followed the signature calculation process described in the Signature API documentation.
AuthFailure.TokenFailure	Token error.
AuthFailure.UnauthorizedOperation	The request is not authorized. For more information, see the CAM documentation.
DryRunOperation	DryRun Operation. It means that the request would have succeeded, but the DryRun parameter was used.
FailedOperation	Operation failed.
InternalServerError	Internal error.
InvalidAction	The API does not exist.
InvalidParameter	Incorrect parameter.
InvalidParameterValue	Invalid parameter value.
InvalidRequest	The multipart format of the request body is incorrect.
IpInBlacklist	Your IP is in uin IP blacklist.
IpNotInWhitelist	Your IP is not in uin IP whitelist.
LimitExceeded	Quota limit exceeded.
MissingParameter	A parameter is missing.
NoSuchProduct	The product does not exist.
NoSuchVersion	The API version does not exist.
RequestLimitExceeded	The number of requests exceeds the frequency limit.
RequestLimitExceeded.GlobalRegionUinLimitExceeded	Uin exceeds the frequency limit.
RequestLimitExceeded.IPLimitExceeded	The number of ip requests exceeds the frequency limit.
RequestLimitExceeded.UinLimitExceeded	The number of uin requests exceeds the frequency

	limit.
RequestSizeLimitExceeded	The request size exceeds the upper limit.
ResourceInUse	Resource is in use.
ResourceInsufficient	Insufficient resource.
ResourceNotFound	The resource does not exist.
ResourceUnavailable	Resource is unavailable.
ResponseSizeLimitExceeded	The response size exceeds the upper limit.
ServiceUnavailable	Service is unavailable now.
UnauthorizedOperation	Unauthorized operation.
UnknownParameter	Unknown parameter.
UnsupportedOperation	Unsupported operation.
UnsupportedProtocol	HTTP(S) request protocol error; only GET and POST requests are supported.
UnsupportedRegion	API does not support the requested region.

Service Error Codes

Error Code	Description
InternalServerError.InternalError	An internal error occurred.
InvalidParameter.ImageSizeTooSmall	The image resolution is too low.
InvalidParameter.InvalidImageContent	The image content is incorrect.
InvalidParameter.InvalidParameter	The parameter is invalid.
InvalidParameterValue.EmptyImageContent	The image content parameter is empty.
InvalidParameterValue.ImageSizeTooSmall	The image resolution is too low.
InvalidParameterValue.InvalidContent	<code>FileContent</code> and <code>FileUrl</code> are empty.
InvalidParameterValue.InvalidDataId	The <code>DataId</code> format is incorrect.
InvalidParameterValue.InvalidFileContentSize	The image file content size is exceptional.

InvalidParameterValue.InvalidImageContent	The image content is incorrect.
InvalidParameterValue.InvalidParameter	The parameter value is incorrect.
OperationDenied	The operation was denied.
ResourceUnavailable.ImageDownloadError	Image file download failed.
ResourceUnavailable.InvalidImageContent	The image resource is incorrect.
ResourcesSoldOut	The resources have been sold out.
UnauthorizedOperation.Unauthorized	Operation not authorized/No valid package/The account is overdue
